I think, if you want to print to your SLM laser printer, see what's on your screen, and write stuff to your hard drive, then you need ST RAM. Otherwise, you don't need it. :-) I would recommend at least 4megs though (of ST RAM).

>That's good news. How about games? Do you think all of the Falcon030
>games will be able to run on a TT030 using fastram?

No. I'm sure most of the Falcon030 games will be written with the extra graphics modes, sound, blitter, and DSP capabilities of the Falcon, which aren't found on the TT. Besides, I wouldn't buy a TT to play games.

In other words, you DO NEED ST RAM...

That means that ST RAM will always hinder future faster Atari computers.

Until, I guess, you don't run any ST software on your new computer.

Let's say I want to buy a future FALCON030 at 32 MHz, but I have game
software created for the Falcon030 at 16 MHz.

Does this mean I will have to keep my Falcon030 at 16 MHz in order to run the
game software? That's nuts.

It is my understanding (and Ed said so) that the video hardware can
only read from ST RAM. Some programs Malloc memory then later ask
the video memory to display that memory - such programs must have
the ST-MALLOC (or whatever it's called) bit set in the program header
(using the Fileinfo CPX, for example) in order to work correctly.

Anyone who understands the differences, please add/correct.

Nope... what it means is that the memory that is accessible to both the
custom chips and the CPU (the "ST RAM") will be slower to access, whereas
the "TT RAM" will be the sole province of the CPU, and hence, much much faster.

8. IMG ---> GEM/PS/EPS

Newsgroup: comp.sys.atari.st
Date: 1993-06-01 09:19:35 UTC
From: sidb@sci.kun.nl
Message-ID: <C7xr8n.JG0@sci.kun.nl>
Source record: 205091

Hi everyone,

I've got myself some interesting IMG-files, which I would like to use in some documents. The problem is that I prefer to work with LaTeX at school, so I can only use (encapsulated) postscript. I can convert GEM to postscript, so what I'm searching for is a program to convert IMG to GEM or else IMG to (encapsulated) postscript.

Is there a pd-program to do this and if so, where can I get it?

Greatings,
Sid Brouwer (sidb@sci.kun.nl).

9. NEW UUCODER (based on Steve Yelvington's UUCODER source code)

Newsgroup: comp.sys.atari.st
Date: 1993-06-01 09:55:50 UTC
From: mforget@elfhaven.ersys.edmonton.ab.ca
Message-ID: <H.eg.i5Ly3H2j7nY@elfhaven.ersys.edmonton.ab.ca>
Source record: 205088

In my never ending quest to write programs people like, I am releasing
a _completely_ rewritten version of ESS UUEncode/UUDecode.

This version looks quite a bit like UUCODER by Steve Yelvington. In fact,
it is based on the source code of that very program. I have made some
fairly extensive modifications to the program, and come up with this:

*) A *GEM Program* (menus, dialogs, mouse) that can both encode and
decode files (one program does it all). The user can set the size
of the file segments (if any) and whether or not the full path of
the file being encoded will be stored in the encoded file, or just
the filename. While encoding or decoding, the user is shown an
informative progress display, featuring a growing thermometer bar,
the name and path of the current file being processed, and the name
and the path of the target/source file. For users who like to install
programs on the desktop as icons, this program is equiped to handle
an unlimited number of files (like a batch). It will automatically
decide whether it should encode the file or decode it. The program
is faster than any other encoder/decoder I have seen, and has support
for the ARGV, xArg, and old-standard command line formats. The dialog
boxes are all moveable (click on the background) and the screen is
redrawn using raster copies. This program is ideal for floppy disk
users and hard disk users alike.

I hope people like this program (at least I hope they like it a lot moe than
the last version).

I have sent it to atari.archive.umich.edu (the filename should be ESSCOD36.ZOO
or esscod36.zoo) and comp.binaries.atari.st (which I hope will accept it).

A PC will read/write standard ST formatted disks - just bung a ST disk in the PC and download onto it.

There will be no problem reading PC (MS-DOS) formatted disks
on an Atari, as long as you are using the 720 KB format on 3.5"
Don't use Atari-formatted disks, MS-DOS may not be able to read them.

Dont't forget to set ftp to binary when receiving not ASCII-Files
like .zoo or .lzh.

Axel

Just stick the PC disk into your ST and run the stuff from that disk, or copy
it onto an ST disk. The PC and ST use pretty much the same format, except
the ST can use 10 or more sectors per track, while the PC can only do 9.

You don't need any special program to read a pc disk, just put the disk in your st's drive and start double clicking as usuall!!

> Maybe there's a MacBinary converter for the ST, too?

There are several shareware and freeware applications designed for use with Spectre 128/GCR that you may want to look into (they are on atari.archive). None of them do what you want, but I seem to remember that one of the readme files announced the pending release of an ST-side conversion tool.

Of course, Transverter (included with Spectre) will do MacBinary conversions to and from an MFS formatted hard disk. Also, there is a product that claims to do this from HFS formatted disks (I think it is called MacFree, and is available from Toad Computers 1-800-448-TOAD).

There is a freeware program available for UNIX boxes that will perform many Mac conversions. If you use a UNIX box as an intermediate stop in getting files to your ST, you could use this. Here is the "help" info (gotten by running the program with no arguments):

```
----------
Usage: mcvert { [option] ... name ...} ...
version: 1.90
default: -xDqv

option:
-x BinHex .hqx <-> MacBinary
-r Resource .rsrc <-> MacBinary
-d Data .data <-> MacBinary
-u Text(trans) .text <-> MacBinary
-h Host(as is) .text <-> MacBinary

-D Download (Other -> MacBinary)
-U Upload (MacBinary -> Other)

-p BinHex -> MacBinary => unpack PIT
-q disable unpack PIT
```

```
-I Information only (does not write output files)
-s silent
-S Silent about ``Converting ... '' lines too
-v verbose
-V Verbose, includes debugging information
-H disable skip-legal-but-suspect-lines Heuristic

Environment:
MAC_EDITOR MACA Mac creator for text files
MAC_DLOAD_DIR . directory for -D files
MAC_EXT .bin extension for -D files
MAC_LINE_LIMIT none maximum line length for -Ux files
MAC_FILETYPE TEXT Mac file type for Data, Text, or Host inputs

----------
Hope this helps!

>the best way of getting currency to the authors?

Best is a bank checque or money order made out in US funds given the fee for the cheque/order does not outweigh the shareware fee requested.

One way is to pay the shareware fee using International Postage Coupons (or whatever it is they are called) available from most any postal office. It's not cash, but at least it's usable.

I'd say the main thing is to send the shareware author _something_, even if it is just a postcard saying "love your software." Recognition & respect go a long ways, ya know?

Hi,

I don't want computer flame wars, Or with stats I dont understand why a machine is better than another. What I need is a bit of practical info.

I am setting up a studio and I am looking into many CPU's. So far what I have found that fits my needs and an Amiga With a Video Toaster. I have looked into mac and ibm and havn't found anything there that I wanted.

but sombody told be about a computer called the falcon. but he didnt have much info so I thought you may. Is there anything comparable to what I am looking for with the falcon?

What I need is:

24 bit paint system.
3d rendering with a Single Frame controller
Video switcher
Character Generator
must be NTSC and up to specs.
and have a low enoguh cost so I can plop down more cash into decks and cameras <Where the MAJOR money goes ... Sigh>
and video games and telecom a plus ;)

Thankx

```
Hi guys,

I found this file (and archive) at ftp.uni-kl.de.

uk_demos.txt/zip
--------------------------------------------------------------------
These demos have been written by UK based Black Scorpion Software, a
development team working on Falcon specific games. These demos run on
an ST (or equivalent) colour monitor or on a Television and c onsist
of the following programs.

PLASMA30.PRG
Connect up an amplifier or headphones to the stereo output. Run by
double clicking and then press the space bar when the credits appear.
This rotates, scales and stretches a True Colour picture around the
screen, with a Stereo 16bit 50KHz soundtrack over the top at 30 Frames
per second. Pressing the Space Bar will exit back to the desktop.

PLASMA50.PRG
Connect up an amplifier or headphones to the stereo output. Run by
double clicking and then press the space bar when the credits appear.
This rotates, scales and stretches a True Colour picture around the
screen, with a Stereo 16bit 50KHz soundtrack over the top at 50 Frames
per second. Pressing the Space Bar will exit back to the desktop.

SPEEDER.PRG
Connect up an amplifier or headphones to the stereo output. Run by
double clicking and then press the space bar when the credits appear.
This rotates (move the mouse) a landscape and allows one to fl y
(press the left mouse button for a little speed) around the landscape.
Once again there is a stereo 16bit 50KHz soundtrack over the top.
Pressing the Space Bar will exit back to the desktop.

INTEL.PRG
Run by double clicking on INTEL.PRG. Really colourful Fractals with a
humorous touch in TrueColour mode. This one requires the use of the
reset button to exit.

These demos may by freely distributed.

Enjoy!

Atari UK - 25th May 1993
^^^^^^^^^^
--------------------------------------------------------------------
So it seems they may not have any Falcons to sell, but they do have
demos for them at last :). Hopefully they will give them to dealers etc.
```

It seems strange that they are distributing programs which will not run on a VGA monitor - I thought they were asking developers to write for all types of monitor.

I have not seen your screen saver, but I would like a screen saver that
gave the option of sending a redraw message instead of buffering the
screen. Of course, you still need to buffer the menu bar, but that should
not use too much memory.
I would also like it to watch for MIDI input in addition to the usual
mouse/keybd/serial.
Does such a program exist?

24. Atari 520ST for sale

Newsgroup: comp.sys.atari.st
Date: 1993-06-01 17:59:55 UTC
From: jbleaza%peruvian.cs.utah.edu@cs.utah.edu
Message-ID: <1993Jun1.115956.11032@hellgate.utah.edu>
Source record: 205105
Cross-posted to: comp.sys.atari.st,misc.forsale.computers

I have an Atari 520ST that I would like to try to sell. The package
is as follows:

Atari 520ST
512k RAM
TOS 1.0 in ROM
Atari SC1224 color monitor
Atari SF354 360k (single-sided) floppy drive
Avatex 1200 baud modem
Atari mouse

and whatever software I can pull together.

I also have a couple of joysticks (working condition unknown) and an
Atari trackball that I modified to work as a mouse, if you're
interested. My reason for selling: the 1040 works perfectly and
there's no reason to have both computers around.

I would like to get $150 out of the system, but if this is too high
you're perfectly welcome to make a counter offer.

Thank you,
-- Jason

26. NN help required

Newsgroup: comp.sys.atari.st
Date: 1993-06-01 18:59:24 UTC
From: geoffc@zebedee.uucp
Message-ID: <H.ea.OXB6q0C00GA@zebedee.uucp>
Source record: 205163

Help !

How do I get nn13 to work properly ?

I have unpacked the archive and put all the files in appropriate places as per the documentation (with my limited knowledge of German !). I had some trouble running buildact as my shell doesn't pass 'a b' as a single parameter to sed (which you need otherwise you get a 'sed garbled command' error). I fixed this eventually by moving the sed command string to an external file and patching the buildact.tos binary to now run "sed -f $(NNLIBDIR}\buildact.cmd <%s >%s" - and this generates my active file OK.

The problems come when I try to run nnmaster to get it to recognise my news articles. I can do 'nnmaster -I' to initialise nn OK and this creates all the SYSTEM and GROUP files OK (and the nn.log file shows that the news groups are all recognised OK) but if I just do 'nnmaster' on its own it barfs on me with the error message:

NNMASTER FATAL ERROR
comp.binaries.atari.st (0): cannot open 'x' file (mode=82, errno=20)

This is obviously the first news group in my news.def file it is complaining at but I don't know what the 'x' file is supposed to be (I can't see anything in the docs and I even tried creating a file called 'x' in the appropriate newsgroup directory but this didn't work). I should at this point mention that I'm currently running hermes v 1.04 and trying to put nn in on top as I don't really like the gem newsreader you get in hermes.

Here is the output from nnadmin -C :

Configuration:

BIN: not used
LIB: f:\usr\lib\nn
NEWS SPOOL: i:\news
NEWS LIB: f:\usr\lib\news
DB: i:\news\.nn
DATA: i:\news\.nn\DATA\{group-number}.[dx]
ACTIVE: f:\usr\lib\news\active
Database format is machine dependent (byte order and alignment)
Database version: 0
Recording usage statistics
Mail delivery program: recmail
Query for appending .signature DISABLED
Max pathname length is 255 bytes

and here is a printenv of my environment variables :

```
EXINIT=source d:\etc\elvis.rc
TERM=vt52
TMACDIR=d:\etc
TMPDIR=e:\
NNLOG=f:\usr\adm\nn.log
USR=f:\usr
NNHELP=f:\usr\lib\nn\help
NNDBDIR=i:\news\.nn
NNLIBDIR=f:\usr\lib\nn
NEWS=i:\news
NEWSLIB=f:\usr\lib
```

if you have trouble replying to me, either use the ! path:

27. Interesting speed note (486, 68000)

Newsgroup: comp.sys.atari.st
Date: 1993-06-01 19:07:01 UTC
From: avp@garfield.cs.mun.ca
Message-ID: <1993Jun1.190701.23471@cs.mun.ca>
Source record: 205118

Just an interesting little speed note..

I had to write a prime number finding program for a course,
anyway, I wrote it on a PC at work (cause boy do I love those
great debuggers) and after I got it working, I compiled it and
ran it at home also.

Machine Compiler secs to primes under 1 000 000
---
i486DX2-66 MS Visual C++ 1.0 1.63
16Mhz 68000 Gnu C++ 2.1 22.33

I was pleasantly surprised to see the mighty 486DX2-66 was
only just over 13 times faster than the ole ST.

Source and any questions about the test, just ask!

One other note, some people were writing about the lame
performance specs of MultiTOS under Quick Index, I have very
strong impressions that these benchmark programs will not
produce valid results under a Multi-tasking env. I know Norton
stuff doesn't produce valid results under windows.

From: rossin@hpfcso.FC.HP.COM
Message-ID: <7340134@hpfcso.FC.HP.COM>
Source record: 205143

We put 50 MHz 68030s in our workstations in the late 80's when Motorola was unable to make the 68040 work as advertised. I believe the Motorola just announced a 40 MHz 68040. I have a 33 MHz 68040 in the Motorola base workstation that I use.

As far as fast RAM. You don't have to have fast RAM with a fast processor but you really would like to have it. People in the PC and workstation world use a memory heirarchy. Basically it looks like follows with fast to slow access (small to large space):

Registers internal to the processor.
Small on chip cache.
Bigger off chip cache with one external bus cycle access.
60ns to 80ns DRAM with a few cycle access for a page hit
and twices as many cycle for a page miss.

The 68000 and the 68010 do not have an on chip cache. I'm not sure about the 68020 but the 68030 and 68040 do have on chip cache.

Ted.

From: wells_s@kosmos.wcc.govt.nz
Message-ID: <1ugcr9INN3vq@golem.wcc.govt.nz>
Source record: 205109

```
] Is it possible to copy programs for ST from PC disks and where I can fi
] such a program. I mean program that copies not only ASCII files
] especially *.prg
```

Format a disk on the PC you use.

Copy the files from the ST onto it in the normal manner.

Simple as that! The ST can happily read & write to PC disks without problems, and STE's and above format in a PC compatible mode.

From: aa399@cleveland.Freenet.Edu
Message-ID: <1ugntq$iqn@usenet.INS.CWRU.Edu>
Source record: 205112

I would first like to thank everyone that has had patience with me,
but I have more questions.

I am _really_ confused about something here.

Why does TT030 need TT RAM?

Why can't it just use ST RAM?

Some TT030 users that I've talked with have 4 megs of ST RAM and
4 megs of TT RAM. Why?

PC clones use the same type of memory from the first IBM PC until
the 486 DX. Why can't the TT030 use ST RAM?

Thanks.

34. BOMBS and ICD host adapter ?

Newsgroup: comp.sys.atari.st
Date: 1993-06-01 23:25:26 UTC
From: robin@sherwood.Aus.Sun.COM
Message-ID: <1ugoh6$eoc@sunaus.Aus.Sun.COM>
Source record: 205116

I just installed an ICD SCSI host adapter and on poering up it told me I had
a quantum disk and I asked it to format the disk.

Then I got a line of what looks like BOMBS across my screen and my ST hangs.

I have been unable to use my ST since !!

I have unplugged the ICD adapter and powered of my ST but I still get these BOMBS.

Sometimes I can start to boot from floppy but I never get far - I get the BOMBS
and the ST hangs.

Does anybody know what the BOMBS mean ?

What can I do to make my ST work again ?

Thanks,
Robin Peatfield.

35. Re: IMG ---> GEM/PS/EPS

Newsgroup: comp.sys.atari.st
Date: 1993-06-02 00:04:18 UTC
From: warwick@cs.uq.oz.au
Message-ID: <13698@uqcspe.cs.uq.oz.au>
Source record: 205113

The PBMplus tools include an IMG converter and a PS converter.

For example, to convert foo.img to foo.ps, us:

```
gemtopbm foo.img | pbmtops >foo.ps
```

Yes, that is called "gem"topbm, but they mean the standard GEM image format.
Some package (ours for example) are a bit out of sync, so you might need:

```
gemtopbm foo.img | pnmnoraw | pbm2ps >foo.ps
```

Appologies to non-Unix sites...

I personally can format disks readable for a PC (I have an STE) But
Sometimes if I need a little more space on a disk (820k say -never have
problems with data at 82 x 10 disks) I use DCformat from a.a.u.e
and put a MS-DOS boot sector on it. (gives a 3.2 dos boot) I have even a
a format /q on it and retained the 820k with no problems.

> TOS-Dialog 197% 613%
>
[...]

QuickIndex results should not be taken too seriously. NVDI replaces the VDI, quick index tests gemdos and the bios and aes dialogues. NVDI in fact performs much better than these figures suggest.
Most ST users run GEM programs which do not use gemdos or bios text output.

The following results were obtained using my own benchmark program (GEMBench v2.5), comparing an F030+NVDI 640*480*2 to an ST with a blitter.

GEM Dialog Box: 1.720 328%
VDI Text: 0.430 1312% (v_gtext)
VDI Text effects: 1.015 1521% (v_gtext+vst_effects)
VDI Small Text: 1.140 553% (v_gtext+vst_point)
VDI graphics: 1.640 1126% (v_bar,v_ellipse)
GEM Window: 2.635 167%
Blitting: 0.955 192% (BASIC get and put)
VDI Scroll: 1.185 363% (vro_cpyfm+v_gtext)
Justified Text: 1.545 318% (v_justified)
VDI Enquire: 0.985 273% (all VDI enquire funcs)

39. my entire ST setup ***FOR SALE***

Newsgroup: comp.sys.atari.st
Date: 1993-06-02 00:43:00 UTC
From: v115lue3@ubvmsb.cc.buffalo.edu
Message-ID: <C7yxwv.FBK@acsu.buffalo.edu>
Source record: 205115

I'm selling all of my ST equipment for the price listed at the bottom of this message. I've grduated from school, and due to work I've had to get an MS-Dos notebook instead (for what it's worth, I prefer the ST - more intuitive and fun to use...sigh). I am only interested in selling everything as a package, primarily because I do not have the time to start splitting everything up. On the off chance that you want a specific item, my price is listed w/ each. I will only consider changing the price for someone who is interested in buying the whole package. Here goes:

*** Mega ST2 $600 (includes all upgrades listed)
- nice design, comfortable external keyboard, has room on the motherboard to easily be upgraded to 4 meg

- MIDI ports

- TWEETY board installed (splits the ST's sound output into 2 channels to be played through your stereo)

- SWITCHABLE TOS 1.2/2.06 (the newest TOS, I installed the switch myself; it allows you to have complete compatability with any software by choosing the operating system it's most compatible with. 2.06 is extremely fast and has TONS of features - nicer to use than macs or windows IMHO)

- all the usual ports- parallel, serial, hard drive, 2nd floppy, monitor, etc.

- golden image mouse

- extra atari mouse

- Warp 9 registered & installed

**20 meg hard drive $200

**SC1224 Color Monitor $200
- will accept either 60 or 50 Megahertz sinc

**SM124 Mono Monitor $125
- internally adjusted for maximum screen size

**2400 baud modem & software $50

**external DS/DD floppy $50

**Epson LQ-850 high speed 24 pin printer $200 (needs ribbon)

**Navarone Video Digitizer $40

**Monitor Master $40

**Mouse Master $30

**software: $600
|
- I have a ton of stuff, almost everything you could ever need/want
word processing, telecomm, dtp, programming, graphics, music, a *TON*
of games.

I have *** 335 *** disks of software. Plus an additional 40 or so
blanks.

All appropriate cables, power supplies, and manuals are
included. All of the equipment is in extremely good condition.
Everything is clean and has been VERY well kept.

- I also have some of the boxes for the hardware (computer & 1
monitor I think.

****
Total cost = $2,135
****
******
I will sell it all for $1,000 <---- (that's a good deal)
******

plus shipping (or will deliver within 1 hour driving time of Buffalo, NY)

If you are interested in what I've got, E-mail me at this account. I log
in daily..

You do need some sort of magic box. I know Toad Computers sells one
(1-800-448-TOAD), in addition to multisync monitors. Also, I seem to remember
that there is an info text file on atari.archive that describes how to
build one yourself (and specs on monitors). Let me know if you cannot find
it, as I may have a copy at home.

Yeah, don't you hate it when that I happens? The one I hate is when I go
to the laudromat, climb into one of those huge tumbling dryers, and when I
get out, I'm really dizzy. Man, I hate it when that happens.

Source record: 205122

```
] Why does TT030 need TT RAM?

ST-RAM is a lot slower than TT-RAM!

ST-RAM is 16-bit, TT-RAM is 32-bit! It can handle twice as much
data flow as ST-RAM! (Not the best explanation, but it works :)

] PC clones use the same type of memory from the first IBM PC until
] the 486 DX. Why can't the TT030 use ST RAM?

Hence the reason why PC's have such bad internal-architecture. The
basic internals has remained unmodified for ages whilst every otehr
other platform has the ability to use such things as Fast-RAM
without the famous 'cards'. (Good idea, as you don't pay for it
unless you want/need it, gets expensive eventually though!). The
TT can quite happily use 100% ST-RAM, but it will be slower than
one using TT-RAM!
```

] and put a MS-DOS boot sector on it. (gives a 3.2 dos boot) I have even a
] a format /q on it and retained the 820k with no problems.
```

You must have one of the few PC's with a disk-drive capable of handling 10-sector & 82-track formats! The majority (well, an awful lot), can't! Also, not all DOS versions can handle that size disks (unless it's a 1.44). Probably 3.3 onwards, which most folks have!

>I am _really_ confused about something here.
>
>Why does TT030 need TT RAM?

Because TT RAM is much faster than ST RAM. That's where the TT gets its speed from. It all has to do with the way the TT accesses the different types (and unfortunately, I don't know the gory details). If you didn't have TT RAM and you only used ST RAM, your TT wouldn't be much faster than a Mega STE.

>Why can't it just use ST RAM?

You -can- have 10megs of ST RAM and no TT RAM, although your TT wouldn't be too fast.

>Some TT030 users that I've talked with have 4 megs of ST RAM and
>4 megs of TT RAM. Why?

4megs of ST RAM is adequate for most users, and 8megs total RAM is plenty for most users. Besides, RAM isn't -that- cheap. :-) I've heard about people who've had memory problems with only 2megs of ST RAM and 4megs of TT RAM, especially when they want to print to their SLM lasers, which requires ST RAM.

Hope this helps.

>a DPDT switch. Any recommendations as to what monitor to buy? Or at
>least some specifications? (like things to get and gthings NOT to get...)

Yes, you do need a switchbox. Otherwise, you'll get only monochrome or only color on the monitor. You must fake the ST into thinking which kind of monitor you have connected.

Monitor recommendations: NEC 3D, Sony 1302, or Princeton Ultra 1440.
You're on your own with anything else. :-) I wouldn't necessarily hunt for specifications, even though they are available. Many people have the monitors I listed above and are very happy with them connected to their STs.
Search for the monitors, not the specs.

] I was pleasantly surprised to see the mighty 486DX2-66 was
] only just over 13 times faster than the ole ST.

A 66Mhz chip compared to an 16Mhz chip? The Chip is only 4.125 times faster, but produced a 13-times faster calculation? I'd say that's not bad! (Although a 486 has rather faster data connections than the ST).

Anyone want to try this on a 32Mhz TT? 16Mhz Falcon? (Both 030, should be a laugh!). C-Source code should port really easilly to either for such a simple task!

(BTW, what's an ST doing with a 16Mhz 68000? Or was it a Mega-ST?)

In reguard to how 680xx chips and 80x86 match up I would like to mention
the new "INTEL version of NeXTSTEP".

I've always been reasonable happy with basic performance on the 25mhz
68040 on the regular old NeXTs. I got to play with the beta version of
NeXTstep 3.1 on a 486DX2 66. I found the speed of the version for
the 486 unbearable! After 5 mins I quit playing with it! While this is
no "benchmark" (the NeXT's custom hardware and the INTEL bus have
something to do with it) it does, perhaps, offer some food for thought
in the "My 486 can beatup your 68000" war.

Well, I don't know about colour separating, (or colour for that matter),
but TeX is outstanding, is PD, and the LaTeX format can use EPS files as
graphics...

It's in a.a.u.e in the (strangely enough) Tex directory. Oh, it *is* in
German, though.

Hello,
I am looking for software to convert PC-based graphics to formats
which can be read by atari software.
Especially vector graphics like CGM, WMF or something similar should
be converted to atari GEM or DEGAS.
I also need programs to convert pixel graphics to atari readable
files. It does not matter whether the filters run on the PC or the ST.
Any help would be appreciated. I would prefer PD or Shareware I can
get via ftp.

>DENNIS REMMER D.REMMER@cc.uq.edu.au

I think you will only find one program that can do all this,
its Pagestream 2.21, about $160us, does colour and Postcript output.

The only other DTP program is Calamus, but little support for Postscript,
there system is some 10 times faster than Postscript and will not break the
Bank..

The S/SL version of Calamus is not cheap, the mono 1.9n version is about
$100us...

I don't think yoy will ever find a PD program for this kind of work..

Message-ID: <H.eg.TdV79uvvXtE@elfhaven.ersys.edmonton.ab.ca>
Source record: 205146

There were some bugs in the last version of MasterBrowse that I uploaded to atari.archive a few days ago. I uploaded a new version which should soon appear under the name mb25abin.zoo (or MB25ABIN.ZOO). Here is a list of the changes to this version:

MasterBrowse 2.5a Changes Start Here:

-June 3: Using the key combination for "Write Block" would actually activate the "Print Block Function". This is fixed, now.

-June 3: Using the window slider (by clicking inside the white box) would not actually do anything. This is also fixed.

-June 3: The MegaDepack Interface is now more reliable. If there is an error, you are told exactly what it is. Also, MasterBrowse will no longer try to load the temporary file if the decompression fails.

-June 3: MasterBrowse now has a Quick Scroll Mode. By using the shift, control, and alternate keys to scroll (this is an option - you are not forced to do anything) you can move through a document (by lines or by pages) independant of the key repeat rate.

Certainly progs which redraw windows many times don't work properly. GEM-Bench (note, Ofir!) redraws windows 50 odd times, but under MTOS everytime that happens the icons underneath get redrawn, and that must slow it down by masses. I can't see a solution to that though.

Hi,

I just got a program, for editing and printing a family tree.
The problem is the program uses a standard epson driver, which is build
in the st (they say), but I`ve got a hp deskjet 500.
When I try to print a picture (text works fine) I get all trash, but no
picture.
They (the writers) say there are some PD programs, which will replace the
epson code with other code.
But they don`t say which program.

Can someone tell me which program I must use to print on a hp deskjet 500,
or help me with hints to write it
myself ?

No, I'm sorry, but we can't forgive you :-)

>What in the heck are these binary sources that I see (usually in
>Europe?) They have like Part01.Z, Part02.Z, Part03.Z....etc...

They're probably uuencoded pieces of a program, each piece being compressed (assuming the .Z is compressed, and not the infamous Gnu zip)...

>How can I get the program up-and-running from these cryptic puzzle
>pieces????

(1)

You first need to uncompress each piece. On the unix box here I just type "uncompress *.Z" and all those files are decompressed (uncompressing a file called Part01.Z will result in a file called Part01). There is an uncompress program for the ST that will do this as well...

(2)

You then need to combine the resulting files together into one file. "cat Part0? > Wholfile.uue" would concatenate all the Part0? files (Part01, Part02, etc) into the file Wholefile.uue on a unix box ("copy Part01 + Part02 ... + Part0n Wholfile.uue" would be the way to do so on a dos-type box). Or just pull them in to an editor in the right order.

(3)

The final step is to uudecode the one file (Wholfile.uue in this example). If your uudecoder is smart enough, then you would simply need to uudecode the file from this point. However, you may find it necessary to go back before step (2) and edit out the "header" information (the "mail message" info, like at the top of this post) before you combine the files Part0? together. In any case, on a unix box you type "uudecode Wholfile.uue" and the coded file will result (the filename of the resulting file is on the line that begins with "begin"). Again, there are a couple different uudecode (and uuencode) programs available for the ST.

And that's it!

Robert Anisko
anisko@usdtsg.daytonoh.ncr.com

...sounds like you found something like the comp.binaries.atari.st
archived somewhere, huh? :-)

64. Escape control sequences?

Message-ID: <1993Jun2.133232@cs.bham.ac.uk>
Source record: 205142
Cross-posted to: comp.sys.atari.st,comp.sys.atari.advocacy

Hi!

Now that DeskTracker has been on various FTP sites for quite a while, I wonder whether those of you who have tried it could just hit reply and stick some answers to the question below..?

Which FTP site did you use?

Which version of dtmt did you get?
[there have been 3]

When did you get it?

Did you keep it or delete it?

Either way, why?

Any suggestions for new versions?

In case you're wondering, a new version will be realeased in about a months time, with the following features:

o All-in-one ACCessory (no auto folder program)
o Changable Oscillo and Analysis window sizes
o Settings can be saved to the dtmt.inf file
o Automatically works on a Falcon!
o Total size of files down from 55K to 45K
o Several bug fixes

And possibly
? Drag icons to ACC window under MTOS
? STfm version

Thanks for your time!

David.

>I was pleasantly surprised to see the mighty 486DX2-66 was
>only just over 13 times faster than the ole ST.

13 times is a pretty hefty difference; the clock speed difference alone
would account for only a factor of 4. Keep in mind that the DX66's are
clock doubled, so they run at 33Mhz unless they get cache hits. That
gives you only a factor of two in some cases.

Also, you may be comparing the compilers more than anything else here.
Microsoft's stuff is comprehensive but not necessarily cutting edge.
I'm told that until recently they did the LALR tables for their
compilers *by hand*.

GCC, on the other hand, has been contunually refined over the past
several years, and now produces really good code.

Try GCC 2.4.1 on the PC (DJGPP) and GCC 2.4.1 on the ST. The numbers
may come out almost the same. Then again, you may find that Visual C++
is a piece of junk in terms of code generation. Suspect anything with
a "1.0" in the name... :)

Has anyone else had problems with Freeze Dried Terminal (newest ver.)
"skipping" characters? I ask because it only seems to have done this since
I installed a 101key keyboard on my ST. I would blame my keyboard modification
if it weren't for the fact that no other software does this.

68. Need help setting up MiNT

Newsgroup: comp.sys.atari.st
Date: 1993-06-02 13:27:40 UTC
From: swwhatley@lescsse.jsc.nasa.gov
Message-ID: <swwhatley.739027660@node_ecdd>
Source record: 205147

I have a MEGA 4 ST with TOS 1.2. I am trying to install MiNT. The problem is that MiNT comes in many pieces. What do I need to install? I have the following pieces:

MiNT 9.5 binaries.
Ksh, sh, csh,
init binaries,
GNU file utilities,
VDImgr
mperl
(will be getting the MiNT version of gcc)
st_login binaries

I would like to more than just the bare minimum setup but I also don't have more than 70M of hard disk space. I also have the following questions about MiNT.

1. Can I run GEM programs like GFABASIC, Flash, the Cyber software (ie CYPAINT, CAD3D2, ...) while running MiNT?

2. Is VDImgr a X windows server? If not is there a X windows server for MiNT?

3. Is there a way to Minix type file names using MiNT but still have the disk partition usable by TOS?

Any help will be appreciated.

Thanks,
Steven Whatley

GEM-View 2.30 is nearly ready (the least version for a while) and JPEG
version 4.0 are included. Loading JPEG is 2-times faster in GEM-View 2.30

I hope to upload the new version to some ftp-servers in Germany in 2 or 3
weeks! Some other interesting changes and extentions are made (you can see
it in the LIESMICH or README-file).

>But they don`t say which program.

Yes, in order to print a screendump from your ST to your HPDJ, you need one
of two things:
1) a screendump printer driver designed for your HPDJ (these should be
available as PD or shareware);
2) an Epson emulator cartridge for your HPDJ.

The second option is the most desirable, albeit more costly. The Epson
cartridge is about $60-$70, I think, but eliminates all these kinds of hassles.

These files are "compressed" files and need to be decompressed after you
have transferred them. I believe that I dl'd a compress program off of a.a.
that takes care of the decompression.

Dave,
Correct me if I'm wrong, but doesn't the 68000 only have a 16 bit
bus? That should just about double your 4.125 to give you at least a factor
of 8.25, not even considering the data and instruction caches on the 486-66!

Later,
Bernard Mikowski

Read on GEnie the other night that Atari has quietly changed the hard disk configured Falcon030 machines from a 65Mb internal drive to an 84Mb unit at no additional cost. Although it's always subject to change, the current units feature Conner drive mechs. It was probably due to a supplier problem. At any rate, a few additional Mb of storage space is quite welcome. :)

79. Laser Printing and the ST

Newsgroup: comp.sys.atari.st
Date: 1993-06-02 16:41:15 UTC
From: lombardo@cwis.unomaha.edu
Message-ID: <lombardo.739039275@cwis>
Source record: 205157

I am considering buying either a laser printer or an ink jet printer for my 2.5meg ST. First of all, how is a laser printer hooked up? Do you use the parallel printer port? Also, how much memory does a laser printer require? Should I buy a program that can specifically use the fonts of my printer, or is that even realistic?

Say, for instance, that I buy a Hewlett Packard IV (I think that has built in fonts) will I be able to use the scalable/built in fonts with st software? or am I better off using programs that have fonts that the printer can download?

Also, what are the speed/quality comparisons between ink jet printers and laser printers? What are the prices of either ink jets or laser printers?

Mainly what I am looking for is a laser quality printout, not so much speed. I would like to get a good printer, but I do not have much money at all to spend. I seem to remember panasonic offering a HP II compatible printer for under $600.... is that right? How much are ink jets?

} GNU file utilities,
} VDImgr
} mperl
} (will be getting the MiNT version of gcc)
} st_login binaries
}
} I would like to more than just the bare minimum setup but I also don't have
} more than 70M of hard disk space. I also have the following questions about
} MiNT.

I would suggest you use my MiNT Distribution Kit (available from a.a.u.e). It allows you to set up all of what you want above in a subset fashion, so you only install what *you* want, not what *I* think is necessary. The kit comes on 9 disks, with another 6/7 disks worth of upgrade files. You need to install the base kit, then choose your upgrades and install them as well.

The kit comes with 2 programs (SETUP and INSTALL) (*) which will make a partition of your disk (NOT C:, choose D: or something) into a unix-like partition with /usr, /bin etc. filestructure; (So, all gcc include files are in /usr/include, for example). In this partition, (which can be minixfs or TOS-fs) you create your customised environment.

mperl isn't yet in the kit, (can't remember why - I think I had some difficulties with it...). I assume by VDImgr you mean 'mgr', the Bellcore Windows mgr, which is available.

}
} 1. Can I run GEM programs like GFABASIC, Flash, the Cyber software (ie
} CYPAINT, CAD3D2, ...) while running MiNT?

Perhaps. Intrinsically, there is nothing stopping you. I don't think GFA likes MiNT - but then GFA basic is just about the most 'unclean' program I've come across (see (*) below). I generally boot up into MiNT and run all sorts of programs without problems, basically it depends on how close to the official guidelines the developer has stayed. GFA doesn't know the word.

}
} 2. Is VDImgr a X windows server? If not is there a X windows server for
} MiNT?
}

No and No. The one thing (that I can see) stopping an X server under MiNT is
the lack of sockets in the kernel. There was a group working on sockets some
time ago, but I've not heard anything since. Pity. I've gcc-ed the X11R5
distribution, and the non-ddx parts (device-dependent) worked fine apart from
the socket-like calls...)

mgr is a windows interface that used to be around on Sun workstations before
X came along. It's probably still used in places (In fact I've seen ports to
DECstations, but it's not as mainstream as X)

} 3. Is there a way to Minix type file names using MiNT but still have the
} disk partition usable by TOS?
}

Nope. The way minixfs works is to replace the TOS filesystem with a loadable
device driver (a .xfs file) which "kicks in" to replace the standard TOS
disk manipulations when you're accessing a minix-like partition. The only way
to have that sort of functionality is to run MiNT I'm afraid. TOS just isn't
up to it...

} Any help will be appreciated.
}
} Thanks,
} Steven Whatley
} Email: swhatley@blkbox.COM
}

SjG

(*)
The Kit's main programs (SETUP and INSTALL) are actually written in GFA basic
which has caused me no end of grief over the last 8 months. I'm in the process
of re-writing them in C++ using Warwicks gem++ library. This is my excuse for
whynothing has happened on the MDK scene for a while - it will (ed: is this
a promise or a threat ?)

>
> What can I do to make my ST work again ?

It's a little hard to know what your exact problem is if we don't know what your system setup is like. How much memory do you have? It is best to have at least a 1 meg ST. I have a meg STfm with TOS 1.0, with a Seagate ST296N 85 meg hard drive, and it's never given me any trouble. How big is your hard drive? My BBS uses the ICD host adaptor as well, and uses a Micropolis 146 meg and Quantum 426 meg together, both being SCSI.

How many bombs march across your screen?

85. Need suggestions for Music Programs

Newsgroup: comp.sys.atari.st
Date: 1993-06-02 18:29:28 UTC
From: jmellby@lluvatar.dseg.ti.com
Message-ID: <C80BD6.JDs@m2.dseg.ti.com>
Source record: 205164

A non-computer-literate friend asked me to find out what are the best Atart ST Music Writing programs. We wants the program to be able to capture music typed on the keyboard (a midi-keyboard I presume, not the typing keyboard). Then she wants to be able to edit it, adding words to the music, and finally print the result.

Can anyone suggest a good (and economical) program for these requirements? If you send me mail, I'll summarize for the net.

87. Nifty Mail

Newsgroup: comp.sys.atari.st
Date: 1993-06-02 19:49:35 UTC
From: neurom@u.washington.edu
Message-ID: <1uj08fINNiu@news.u.washington.edu>
Source record: 205167

I know this has little (nothing?) to do with Atari computers, but since I do the majority of my posts here, I figure, Hey! Why not? So, I sent a message to a newbie on the net ;) and I got this reply:

Date: Wed, 2 Jun 93 15:41:26 -0400
From: postmaster@whitehouse.gov

Thank you for sending in your thoughts and comments to the President via electronic mail. We are pleased to introduce this new form of communication into the White House for the first time in history. I welcome your response and participation.

As we work to reinvent government and streamline our processes, this electronic mail experiment will help put us on the leading edge of progress. Please remember, though, this is still very much an experiment.

Your message has been read, and we are keeping careful track of all the mail we are receiving electronically. We will be trying out a number of response-based systems shortly, and I ask for your patience as we move forward to integrate electronic mail from the public into the White House.

Again, on behalf of the President, thank you for your message and for taking part in the White House electronic mail project.

Sincerely,

Marsha Scott, Deputy Assistant
to the President and Director
of Correspondence

Neat, hu? I know, sorry for wasting bandwidth, but I kinda like it!

>bus? That should just about double your 4.125 to give you at least a factor
>of 8.25, not even considering the data and instruction caches on the 486-66!

I do know that 68000 operations on longs are faster than successive
operations on words. I think the 68000 is on both sides of the fence
in this regard. This has been said to be the reason for the "ST" name
-- "Sixteen/Thirty-Two".

But, again, it depends on the PC compiler environment. The PC version
of GCC will compile 32-bit code, and all int reads and writes will be
32 bits wide. But if Visual C++ is like most PC compilers, it will
produce 16-bit code, which will run slower. So it's really hard to
tell.

Unless you're running in protected mode (32 bit code), the memory model
you choose has a lot to do with the performance of PC code. Anything
that uses "far" pointers will lose compared to equivalent 32 bit code,
for example.

: a long ways, ya know?

Um, as a shareware author, I just have to say that I really prefer to receive cash rather than postcards (if I wanted postcards, I would have said so in the first place :-) ... for shareware fees that are reasonable in amount, I recommend just stuffing cash dollars in an envelope. Bank transfers, checks and all that stuff are PROHIBITIVELY expensive. Don't forget that German banks charge fees as well, so you end up paying loads of money to two banks (more if you're unlucky; some banks use other banks as handling agents for international business transactions) and no money to the shareware author!

: those currencies that I do not possess (I want to avoid high bank commission
: rates)

Here in Germany, bank commission rates for money exchange (cash for cash) are
the lowest you can possibly expect to pay for any international money
transaction involving only a small amount of money. So buy German marks or
US dollars and stuff them into an envelope.

: on an Atari, as long as you are using the 720 KB format on 3.5"
: Don't use Atari-formatted disks, MS-DOS may not be able to read them.

The reason for this is that Ataris are smarter than PCs :-) , now really,
a lot of information about the disk format is in the first sector, but PCs
don't use that information, but look at a Media Description Byte instead.
While all that fancy info is correct on Atari formatted disks, the MDB is
not (sometimes), so a PC may choke on an Atari disk.

So just format your disks on the PC, and off you go! You can use any
720KB 3.5" PC disk in an Atari ST with zero hassle. You can read from it,
you can write to it. Just don't format it on the Atari.

am>
am> Why does TT030 need TT RAM?

It does not *need* TT ram. (look below)

am>
am> Why can't it just use ST RAM?

It can. (look below)

am>
am> Some TT030 users that I've talked with have 4 megs of ST RAM and
am> 4 megs of TT RAM. Why?

Well the two kinds of RAM is different in several ways. Because of the
68000 processor having only 24 bits of valid address-space, 24 bits (or
upto 16 Mbyte) is all this processor can make use of. The ST uses a
68000 processor, thus what is called ST-ram in a TT, is the address
range available with 24 bits. This same memory is also used by the
video-logic, and the ACSI dma-interface on the TT. The video logic,
ACSI and sound dma circuits have only 24 bit address range, and can
only access the ST-RAM. Because the video-logic accesses this
memory, it is not available all the time to the CPU, which make it not
very fast. In addition, it can not operate in burst mode.

TT-ram, is the RAM that is placed in addresses above 16 Mb. This ram
is not touched by the video-logic, and is therefor much faster. In
addition, it can also operate in burst mode (provided that the RAM
chips you have support it. The RAM that comes with the Atari TT-ram
cards support burst-mode). This sums upto that programs that are
running purely in TT-ram, often runs as much as 50% faster than if
they were run in ST-ram. That is why people *want* TT-ram. ST-ram is
needed, or you would not get any video-output.

am>
am> PC clones use the same type of memory from the first IBM PC until
am> the 486 DX. Why can't the TT030 use ST RAM?

486 have the same type of memory as the first IBM PC ???
That is a joke, right ???
expanded memory, high-memory, ... mucho fiddling in config.sys and
EMS-drivers puh....

Well there really is nothing to it with the TT.
At first I only had 4 megs of ST-ram. When I later bought 4 megs of
TT-ram, it was as easy as opening the machine, putting in the card,
and closing the machine. When I rebooted the machine, it instantly
"saw" the 4 megs of extra RAM and was able to use it. Just like that.
I assure you, the procedure of doing the same on an IBM-clown is
horrifying. You have to go through all kinds of setup programs and...
nah I don't even want to think about it...

am>
am> Thanks.
am>

You're welcome.

Erling

Not quite, even with only ST-ram, the TT is about 4 times as fast as a
normal ST. The STE is (at most) twice as fast as the standard ST.

>the parallel printer port? Also, how much memory does a laser printer
>require? Should I buy a program that can specifically use the fonts of
>my printer, or is that even realistic?

Laser printers either have their own memory or rely on the computer's RAM
(as does the Atari SLM lasers). Lasers can connect via the DMA port on your
ST or the parallel port or the serial port... it depends on the printer.

>Also, what are the speed/quality comparisons between ink jet printers
>and laser printers? What are the prices of either ink jets or laser
>printers?

Ink jets are slower than laser printers, typically printing about 2 ppm vs
4, 6, 9 or more ppm. Of course, they are cheaper. The HP DeskJet 500 (and
the older Plus models) typically sell new for <$500 and can be purchased
used for $250 or less (as per ads here on the net). Lasers generally begin
at $800. Inkjet printers provide high quality, laser-like output but are
slower, are picky about paper type, and the ink tends to smudge when wet.
Inkjets provide an excellent value but it's worthwhile to consider a laser
now that prices are dropping rapidly.

Last bit of advice... examine the SOFTWARE you intend to use with your new
printer and make your printer choice based on what it works best with.

>
>In other words, you DO NEED ST RAM...

Well. If you don't have an SLM printer, 2MB will be fine (it's better
to have more TT RAM...).

>That means that ST RAM will always hinder future faster Atari computers.

Wrong. ST RAM is generic I/O slow RAM. That's why there *IS* the faster
TT-RAM (don't tell my that the existance of ST RAM makes the TT RAM
slower). And, btw: future machines don't have ACSI, so SLM printing
isn't an issue. In addition, there's no reason why future machines
can't have a separate video RAM.

>Until, I guess, you don't run any ST software on your new computer.

If the software is doing things RIGHT, it would work fine.

>Let's say I want to buy a future FALCON030 at 32 MHz, but I have game

>Does this mean I will have to keep my Falcon030 at 16 MHz in order to run the
>game software? That's nuts.

And wrong. At least as long the game developers are intelligent enough
to use timers for timing (instead of CPU loops).

Sure :-) Actually the bit works tha other was around. Then, 'new'
programs (written after the TT was launched (autumn '90)) can and
should use Mxalloc to explicitly specify which kind of RAM they need.

I have obtained this code and _TRIED_ to compile it for the ST
using Mark Williams C (the recommended compiler). All I can say is that
the code (as it exists in the above-mentioned archive) can _NEVER_ POSSIBLY
HAVE BEEN SUCCESSFULLY COMPILED. For example in the ST-specific source
file (st52.c) there is an identifier "mousehidden" which is completely
undefined. Now I guess this is the opposite of "mouseon", which is also
present, but _WHY_ have these _ELEMENTARY_ bugs not been ironed out before
submission? Does the author wish to waste people's time?

My conclusion is the source (as is) has never been compiled for
the ST and unless you have a great deal of time for "debugging" I would
not advice people to "have a go" at this.

Now the author, Daniel Lawrence (Funny, I had always thought of
David Conroy as the author of Micro-Emacs??) appears to wish that users
register with him if they use Micro-Emacs. Below is a part of his
"readme" file:-

!! If you like MicroEMACS, and want to see more work, new versions
!! and other shareware software to go along with it, show your support by
!! registering your copy. Send your registration of $25 US and I will place
!! you on the registration list. You will recieve information on new
!! releases and preferential support. If you have recieved MicroEMACS
!! through a software library, a CDROM collection, or a user's group, none
!! of those fees are passed along to the software author. Register with me
!! and get the latest versions, info and have a voice into future
!! directions.

May I suggest that anyone who badly needs Micro-Emacs 3.12 (I don't!)
CONTACT him and send the $25. Then perhaps he might bother to compile it for
the ST and send you the binary on (two) floppies as is stated elsewhere in
his documentation.

W. Alan B. Evans
[wabe@ukc.ac.uk]

P.S.: I'd better add his contact details:-

!!

I'm a fan of C-Lab Notator myself. I have owned and used it for two years now. It sports a very complete sequencer and notation packgae which interact very nicely (to easily edit what you have recorded from your keyboard, you can literally drag notes around the staff with your mouse and adapt the notes a thousand different ways - as you do so, you immediately hear the changes thru your keyboard or sound module!). However, as a commercial product, all this power doesn't come cheap... it will cost around $700.00 - $800.00. Bye the way, the notation output looks very professional, especially printed on a DeskJet or Laser.

Cubase is another commercial offering that is every bit as good as Notator, and costs about the same. I am unfamiliar with this software, though, so can't really comment on it.

Another cheaper alternative is EZ Score Plus, from Hybrid Arts (now Barefoot Software I believe). It is far more limited than the above mentioned packages, but only costs around the $100.00 mark.

I do not believe there are any PD or Shareware offerings in the MIDI notation world for the Atari :-(Someone please correct me if I'm wrong.

>
> Can anyone suggest a good (and economical) program for these

Like everything else, you'll only get what you pay for. If professional looking final output is what's important, be prepared to part with some serious $$. If quick and dirty is all that's needed, it could be had for probably around $100.00

AUTO folder????!!!! ICDBOOT should NEVER be placed in your autofolder!

Use HDUTIL.PRG to install a bootable driver on your drive. (HDUTIL
will actually yell at you if it finds "/AUTO/ICDBOOT.PRG" on your boot
drive)

AND OUR DRATTED NEWS SERVER ATE MY THIRD CONSECUTIVE TRY TO POST!!!!!

All right--here we go again! John Hutchinson was talking about what
was the best way to send money to deserving shareware authors
overseas (I am such a slime I never even sent a postcard to that
Frenchman who did ZIP), and Dieter Fiebelkorn and GEMVIEW had come
up, and I said:

It's my gratitude to them all that prompts this post! The BEST
way to send any money overseas is to buy a newspaper and go to the Post Office
and ask for an International Money Order. They cost around $4 or so, but
you'll need your newspaper to figure out the day's rate of exchange for
whereever, since they Post Office will want that money too, for some
reason!

Then you buy one of those "stamp-cum-envelopes" they sell at the
Post office to mail the FORM (which is a mess) to St. Louis, from which
the Post Office will make out and mail a draft in the other fellow's
currency and mail it to the address on the form. You put the receipt in
an envelope and mail the developer his letter telling him what to expect,
along with your thanks. I WANT to send Dieter something very much (except
that he can't load Atari-compressed IFF files or DEGAS BL? files) but
(woe!) I'm a beta tester for a rival product! #$#@! I may do it anyway.At
any rate, to quote the Human Waffle, "that's your way, mah fellow

TOS 2.06 is apparently processor-independant, and will run on 680?0
CPUs. I'd imagine Falcon TOS would too, but it's probably full of
Falcon-specific code for the DSP and whatnot.

I agree with what Warwick said though, it's the chicken (checken? :) and the egg problem. Even though no one with an Atari (ok, almost no one) has a CD-ROM drive, there is still stuff you can get for it. Someone mentioned clip art, a good example, also you can get disks with fonts on them, disks with several hundred (lots) high-quality GIF pictures on them, disks with MPEG animations, all sorts of cool stuff. Some of this can be used by Atari computers right now, other stuff will have to wait a bit longer for drivers to come out (like the MPEG stuff, for example). Having atari.archive on CD would be incredible! You'd never have to ftp again, except for the new stuff.

Anyway, I would love to get a CD-ROM for my Falcon, it should only cost about $300 or so and I can just plunk it into my HD case. Any CD < $50 seems to be a great buy to me since you're getting over 600 MB of stuff! Plus there are some nifty possibilities to control audio CDs and interface them with the Falcon too, what with the audio dimension being so important on the Falcon.

Message-ID: <82603@cup.portal.com>
Source record: 205198

To further help clarify the answers to Len's original question about
the differences between "ST RAM" and "TT RAM"... there is no really
fundamental difference between the two.. they both use basically the
same kind of RAM chips.

The difference is how the memory is laid out and configured.

The TT can be thought of as almost a "dual-purpose" machine.

To maintain backwards compatibility to ST software, it essentially
"emulates" a regular ST, right down to the 24bit address bus and 16 bit
data bus. The "ST RAM" in a TT is configured to look and act just likt
the memory in a "real" ST.

In the ST, the video circuitry shares the bus with the CPU, which means that
the CPU runs at less than the ideal maximum speed. The TT maintains this
architecture to keep compatibility with ST software. Thus programs which
need to be run on an "ST" (programs which need to access the DMA port, the
ST sound circuits, the MIDI ports, and the ST video), have to be run in
"ST RAM". These programs DO run faster on a TT due to the improved
internal architecture of the 68030, and the faster clock speed, but not
as fast as the TT is capable of in its "native" mode.

In "TT" mode, the computer can make use of the full 32bit memory layout of
"TT RAM", and assuming there were any, it could use programs written
specifically for the 68030 CPU.

Just as "everyone knows" the 80486 is "crippled" because it has to be
backwards compatible to the 8088, the TT isn't the machine it could have
been if it wasn't backwards compatible to the ST. That isn't necessarially
a bad thing.. without ST software to run on it, the TT would be a rather
expensive paperweight.

(Oh.. and regarding memory expansion on a PC.. I went from 4 Megabytes to
8 Megabytes on my 386DX simply by plugging in 4 more standard SIMMs..
no expensive proprietary "daughter boards" that are available from only
one source, and difficult to obtain sometimes, no "designed in"
4 megabyte limit. I simply rebooted, and the system saw 8 megabytes of
memory. No messing with CONFIG or AUTOEXEC either.. of course, I'm
running OS/2, which eliminates most of the things Atari owners like to
use as "put downs" for PCs...)

>slower). And, btw: future machines don't have ACSI, so SLM printing
>isn't an issue. In addition, there's no reason why future machines
>can't have a separate video RAM.

THIS is getting VERY interesting. If what you say is true, we may only
see fast RAM in future Falcon computers. Separate video RAM does
seem to be a possibility, doesn't it?

It almost seems weird to have ST RAM and TT RAM in all new machines
if you are only going to use TT RAM for your software...

Keep ST RAM just for video? Doesn't seem right...
You hit on the head of where I'm trying to go with this thread. Thanks!

I saw this article in the current issue of ST-Report and though it would be interesting to discuss and maybe support.

> A FRESH OUTLOOK! STR Feature A few GOOD Ideas??
"""""""""""""""""""""""""""""

ATARIANS TRYING TO HELP ATARI
=============================

by Robert Dytmire

Since my article in STReport 9.20 I have received some very enthusiastic responses. Some questions were raised on how feasible the takeover of Atari really is. Well, if Atari goes to federal bankruptcy court and we, the users have bundled together a recovery plan AND some support from a major backer (Xerox is now a stockholder in Atari!). If Warner Communications could be convinced to support us, then the money issues take care of themselves. What these companies will want to see is a strong business plan and lots of support from the people involved. That means FIRM support of my general business plan, and ACTIVE participation from ALL the Atari users left. After all, several major companies have been bought out by their employees, why not a user group buying out Atari.

Some Details:

* Our purchasing power as a user group is, at the moment, rather limited. On the good side (for us) Atari's stock is now valued at $.88/share. That means $88 bucks will buy 100 shares! Now multiply that by 100,000 users we're talking 100,000,000 shares of stock (enough to control, maybe even buy outright-I'm having a broker check out the details) the company. Now, in my last article, I said you only needed to invest $15-$20 bucks apiece. I still stand by that for the following reasons:

1) If (when) Atari drives themselves into the ground the stock will be worth much less than $0.88/share. It could be bought for as little as $.10/share if Atari really screws up.

2) We only need to show that we are SERIOUS about this project and raise some REAL money and we'll be able to attract investors. Remember, it's Atari with the bad name, not us.

3) These big companies have no wish to lose money with Atari. If they see we're serious and think we can increase the value of their stock then they will be willing to take additional steps to secure their investment (namely, supporting us!).

EVERY USER COUNTS! I cannot stress this enough. Letters, organizers are NEEDED! If you have never done anything active in the Atari community, if you're reading this in a depressed Atari Community and you feel alone, and if your thinking of going Big Blue then HELP US and HELP YOURSELF! If you are a professional of some sort I NEED YOUR ADVICE! Please don't send any money until I can square away the legal aspects of this project. Organization is needed most RIGHT NOW, EVERY DAY COUNTS and I cannot continue this on my own.

If you know any investors have them contact one of the people on the list at the end of this article and they'll be happy to answer any questions they might have.

Some more details:

I think the best way to go will be for all of us to decide when and how much stock we will purchase. We then elect amongst ourselves a leader who will then be given proxy to vote with our shares. This will, in effect, allow us to control Atari through it's stock. You, the user, will form a block that effectively owns Atari corp. Later, when we've started to re-build, we can issue new stock and re-build the company.

Potential investors:

* Many professionals are always looking for a good deal, even if it involves some risk. Show my articles to your doctor/lawyer/boss and ask if they want to get involved. If they do, show them how to contact me and I'll be happy to work with them.

* Some large direct vendors of IBM clones are taking a beating in the current computer market. Our project may be just what they need to revive themselves. If our business plan is put together correctly, we stand a good chance of attracting a large, established, corporation as a partner in investment.

Additional comments:

* I have read Atari's dealer contract. This contract is probably one of the reasons Atari has such a hard time breaking into the market. I wouldn't sign the thing as written. I admire the current set of dealers all the more because of the risk of potential for loss they are taking (by Atari Corp itself!). One of the first things I would like Atari to do is hire a large customer support/tech staff and re-write that awful dealer agreement.

* The Falcon is an AWESOME machine, but I would like to tell you all a little story (and remember my last article):

In walked a couple looking to spend quite a chunk of money on a new system. They looked at the 386 system and then were shown the new Atari Falcon. The Falcon was shown very expertly to these folks. It's graphics, and built-in windowing features were displayed to perfection. Atari Works (which is the first piece of decent software out of Atari in years) drew their attention. The sale was all but made (I overheard the wife saying "I

WANT it!") UNTIL then husband asked the fatal question: "Can it run EXCEL?". After it was admitted the machine could not (at least not without an expensive emulator) they lost interest in the machine.

Why bring this up? Because it supports my argument that Atari MUST get the BIG TIME software houses supporting their platform AT ALL COSTS! Many users could care less if the machine preforms better than the box over there if the machine cannot run that nifty program that the box can (the old Beta/VHS story). Atari is rapidly painting itself into the BETA corner and can only get out my MASSIVE MASSIVE customer support and a re-tailoring of it's machines. Atari needs a customer support service that is second to none and a very liberal dealer agreement (they should go so far as to GIVE a demo unit to EVERY dealer). They NEED to get a contract with WAL-MART or K-Mart and most of all, they need to stop living in surreal world of their own design.

Contact points:

Robert Dytmire
633 Pony Farm Road.
Jacksonville, NC 28540
(919)-347-2202

G. Allan Mangam
50 Prince Drive
Maumelle, AR 72120

Note: I could use some more regional contact points (Duh!). If you are interested then contact me pronto!

Note: Dropix ST will be out within 30 days!!

Final note: This article may be published freely (PLEASE!) as long as it appears in it's entirety and the contents are not edited.

120. MasterBrowse 2.5b (* NOW _MultiTOS_ COMPATIBLE! *) (a.a)

Newsgroup: comp.sys.atari.st
Date: 1993-06-03 07:48:58 UTC
From: mforget@elfhaven.ersys.edmonton.ab.ca
Message-ID: <H.eg.K7asVu4QrWA@elfhaven.ersys.edmonton.ab.ca>
Source record: 205010

Hi!

MasterBrowse 2.5b has been uploaded to atari.archive, and should appear soon under the name MB25BBIN.ZOO (or mb25bbin.zoo) in the appropriate area.

This version works with MultiTOS! There have been numerous requests for a MultiTOS friendly version of MasterBrowse, and now there is one. How is that for support?

Here is a list of changes to this version:

-June 4: MasterBrowse is now _MultiTOS Compatible_.

Everything works fine, but some options had to be removed (sorry):

1) MasterBrowse no longer uses flying dialogs.
2) MasterBrowse no longer centers dialogs on the mouse pointer.
3) MasterBrowse will not use progress displays with MultiTOS installed.
4) MasterBrowse will not use Popup menus with MultiTOS installed. Instead, an alert box is used.

-June 4: Jump -> Page was fixed (again).

-June 4: The Print Document function had a typing error in the source code which would cause MasterBrowse to bomb. This is now fixed.

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Well I contacted Softlogik on GEnie last Friday, well they got back to me
to-day..

Well the ATARI version is ONLY 2.2..??

I asked about the extra Fonts, I was told that the Plus Pack disks was $10us
there was no mention of these fonts being included with the latest version,
so it looks like there are NO EXTRA fonts with Pagestream..

Note: there are updates for versions 2.21 and 2.22 in there file system on
GEnie but they are for the Amiga, so I think that some one has confused
the extra fonts and version number with the Amiga version..

NOTE: this has nothing to do with the 10 Compugraphic Fonts that I was
on about befor...

Someone asking for `DTP' is unlikely to want (La)TeX; they usually want wysiwyg (not TeX's wygiwyg, What You Get Is What You Get).

Timeworks Publisher 2 is cheapish, and has a reasonable PostScript driver.
You are, however, limited to the `standard' PostScript fonts. And no colour.

PageStream 2.2 supports PostScript, but its screen updates are very slow with PostScript Type 1 fonts (it's much better with the CompuGraphic fonts). It has colour support, and can print colour files to PostScript printers in several ways:
a) Directly to a colour printer.
b) Using dithered `greyscales' to a mono laser printer.
c) CMYK process colour separations.

Each colour can be specified as `separable' or `mechanical', so it's easy to use spot colour as well as process colour.

PageStream 2.2 is currently selling second hand for about 75 quid, I don't know the retail price.

Hmm. Can you do registered post internationally? If so then real cash in one of them would guarentee that the money would get from A to B! Sending cash is as good as sending money orders etc. 'cause if the shareware bloke doesn't write back you then you've lost your money anyway.

Plus sticking dollars/sterling/DM's in an envelope is so easy you might even get around to doing it!

I have worked with Daniel Lawrence over the last couple of months to beta test
MicroEMACS 3.12. On my Atari 1040 STf I used Mark Williams C version 3.. and
have had no problem what so ever to compile the official released sources.

I find your remarks about "mousehidden" interesting and will look in to it.

In the mean time: I have a ue312.zoo file ready containing sources, cmd files
and an executable for the Atari ST. I intended to upload it to a.a.u.e but
could not find a directory where I could put it.

Point me to a system (domain name and IP address please) and a directory to
put it in and I will upload immediatly.

126. For Sale

Newsgroup: comp.sys.atari.st
Date: 1993-06-03 11:23:29 UTC
From: rsl@aplpy.jhuapl.edu
Message-ID: <1993Jun3.112329.7844@aplcen.apl.jhu.edu>
Source record: 204956

I have the following for sale.

external I.B. 5.25" floppy drive
-all cables, manuals, boxes (xcept 5.25" box, maybe)
-everything works perfectly

Atari Software: (includes manuals)

ST Language Disk
Flash V1.5 (comms software for modem)
Word Writer V2.01 (word processor)
-includes dictionary/thesaurus
PC-Ditto V3.0 (IBM emulation software)
-includes utilities for 5.25" drive
MicroLeague Baseball
Empire
Barbarian
Hillsfar (AD&D)
Dungeon Master
Pirates
Silent Service
Phantasie II
Temple of Asphai
Knight Orc

IBM Software: (includes manuals)

DOS 3.3
PC View
Turbo Pascal V3.0
PC-Ditto utilities

I also have a 1040st and SC1224 color monitor,
but I have an offer for those from someone
not interested in the rest of this.

Make me an offer.

127. Poll for MINIX FS

Newsgroup: comp.sys.atari.st
Date: 1993-06-03 11:37:04 UTC
From: castermn@nlsce1.seri.philips.nl
Message-ID: <1993Jun3.113704.19380@seri.philips.nl>
Source record: 204959

Recently I installed the MINIX filesystem on my TT running
MultiTos. I am using GNU file-utilities ported by Hildo
Biersma and the shareble TCSH as shell.
I installed a MINIX fs on a floppy put some file and dirs
on it and did a 'ls -l'. Within 1 sec I got the listing.

I was SURPRISED: using a TOS-floppy the same action takes
about 10 seconds !! Using the MINIX floppy again and doing
the action for the second time the lising comes immediately !

My first reaction: Now I know the reason why MultiTos sometimes
is so slow !
My conclusion: MINIX is *much* faster filesystem than
the TOS fs. It support lower/uppercase
filenames up to 14 chars long.
'links' are supported, etc.

Why not make it the default fs for MultiTos ?

What is 'the worlds' opinion ?

Hope for many, many reactions

Luc Castermans

******** GUCK.. **********

Some time back I asked here about the New none PD version of GUCK 1.9..

I have since found a advert for it in a last years ST-User U.K. (April 92)
the advert is for GUCK 2.0..

It by a company called TITAN Designs Ltd, of Birmingham, U.K.

Is this firm still around..??

Thanks...........

Give GUCK a try I think its great, there are PD versions 1.8 on
many sites...

It can Auto read Text, Graphics and Fonts all from the desktop,
as a replacement to the desktop text reader...(show/print)..

>
>
>AUTO folder????!!!! ICDBOOT should NEVER be placed in your autofolder!
>
This is not true!! ICD do allow for drives other than C:\ to be
the booting drive. If there is no driver on C:\ then you must have ICDBOOT
in the autofolder of your booting volume - be it A:\ or maybe a ramdisk.
Alternatively, you can execute ICDBOOT (from A:\ say) after boot-up and
it will link up any hard-disks you may have OK. This is the normal
procedure if you have a corrupt ACC or similar on C:\ which you want to
de-activate - otherwise, if the corruption causes a warm-boot as is common,
you are caught in an endless loop.

I've been booting up my ICD hard-disk from the autofolder of
"booting" RDE/RDY-ramdisks in this manner for a couple of years. In fact
you _MUST_ work this way if you wish to wake up your ramdisks AND your hard
disks - to my knowledge. The same applies to Atari's AHDI.
>
>Use HDUTIL.PRG to install a bootable driver on your drive. (HDUTIL
>will actually yell at you if it finds "/AUTO/ICDBOOT.PRG" on your boot
>drive)
>
Of course it will!! If you are installing a bootable driver on
C:\ - it does not want to wake-up the hard-drives TWICE!!

Cheers,
W. Alan B. Evans

>ICD haven't whipped up a few discs.

Aren't there CD's out there already that just have data on them?
Like 'Gifs Galore' and PhotoCD etc. Shouldn't any computer with a standard
SCSI CD-ROM drive be able to use these CDs? Well, I guess even those aren't
enough to make an Atari user want to buy a drive. But if they did, they
could use those CDs until some Atari specific ones were available.

>Keep ST RAM just for video? Doesn't seem right...
>You hit on the head of where I'm trying to go with this thread. Thanks!

What is the difference between ST RAM and seperate video RAM?
Never mind, I'll go ahead and tell you - NONE! ZERO! ZILTCH! ABSOLUTLY
NOTHING! A TT with ST RAM and TT RAM is not much different architecturally
than a PC (vomit) with Video RAM and System RAM (except of course, the TT
will easily be able to access all of its RAM without special 'driver
software' and configuration nightmares as somebody else previously mentioned).
A driver is needed for memory? That is obsurd! (on the PC that is, I don't
want you to start a whole new thread saying that a driver is needed for memory
on the TT based on what you read in my article).
This whole thing is getting utterly ridiculous. If you had started
this on comp.sys.atari.st.tech (where it would have belonged way before it
got really repetitive) you would have been flamed off the net by now for
not being able to even comprehend the topic that you started.

>
>Hope that helps a little. Read VT52.h for other details.
>

Well, unfortunately the vt52 termcap entry in UNIX is not up to the ST's
capabilities. If you look closely, it's missing things like reverse video,
or even line deletion. This is an improved termcap entry for the ST :

am|vt52a|decvt52a|atarist|atari|Atari ST vt52 emulator (monochrome or colour):\
:do=^J:le=^H:bs:cd=\EJ:ce=\EK:cl=\EE:cm=\EY%+ %+ :co#80:li#25:\
:nd=\EC:pt:sr=\EI:up=\EA:ku=\EA:kd=\EB:kr=\EC:kl=\ED:kb=^H:\
:me=\Eq:sc=\Ej:ve=\Ee:vi=\Ef:al=\EL:dl=\EM:ho=\EH:cb=\Ed:\
:mr=\Ep:so=\Ep:se=\Eq:is=\Ev\Ee\Eb3\Eq\Ec0:am:pt:

Spiffed up by Charles Savoie (chuckies@binkley) and myself.
So those of you who are using VT100 emulation because VT52 on those UNIX
boxes sucks, you have no more excuses. I find that using this VT52 on the
UNIX machine is faster than having the ST do VT100 emulation. Of course,
things may have to be changed according to your needs (Like the 25 lines.
Some terminal programs use one as information line, so you should put in 24
instead. Other things may be for colour support)

Oh, and since the post was for help on this, here is the meaning of the
various entries :

do : moving the cursor down one line.
le : moving the cursor left one char.
bs : terminal can backspace
cd : clear till end of screen
ce : clear till end of line
cl : clear screen
cm : locate cursor. Add ' ' to the coordinates.
nd : non-destructive backspace
pt : terminal has hardware tabs.
sr : Up one line, scroll down if at top.
up : Up one line
```

```
ku : string sent by up-arrow
kd : " " " " " " " down-arrow
kr : " " " " " " " right-arrow
kl : " " " " " " " left-arrow

Sorry for wasting bandwith but I lost Frank Ridderbusch's address.
Could he or anyone who knows the address e-mail it to me? I've got
some more or less private stuff for him to read so I cannot just
post it here.

Thanks

Just a few words about the MicroEmacs situation. Daniel Lawrence has, in fact, been the guardian of MicroEmacs for at least 5 years now, maybe more. His interests appear to be more slanted to gee-whiz features than work-a-day ones. In general, people who care about a particular machine will take over and do a revision for it, passing diffs back to Lawrence. He tries to merge them rationally. Last I heard, his ST was broken, so he was trying to coordinate ST upgrades by eyeball, which can have its problems.

I got in the middle of things a bit on release 3.11. There were at least 3 really sharp people with firm ideas of where to take that one, in addition to some people who had contributed important code and then gone on to other things. At one point kbad was offering to clean things up for a base version everyone could work from, but 'other things came up.'

So yeah, the code is a bit mixed up. Lots of it is very good, though, and anyone who wants to get a stable base version (preferably compilable with GNU C) together, and distribute it widely enough so those people with firm ideas can try to work from it, is liable to make a lot of friends.

>first place :-) ...

That's all very true, Martin, and I certainly did not mean to imply that users should not attempt to send the requested payment to shareware authors.

BUT... let's be honest here, it is the responsibility of the shareware author to advise his/her users of how to pay the requested shareware fee. If the author just says "send me $10" (or DM, or Francs, or whatever his native currency is) without _any_ advise to overseas users as to how they should pay then I have little sympathy for his lack of overseas registrations.

If you want overseas users to register (pay) for your shareware, you had best make it as easy as possible for them to do so. Let's face it... it's hard enough to get a user to part with his money in the first place!

Just my $0.02 <kindly adjust this amount based on the current exchange rate> :)

Hmmmm, I'd wager that from DOS your system didn't automatically "see" 8Mb of _conventional_ memory, Bob. Sure, OS/2 and Windoze helps isolate the user from memory partitions, but it's still there in full fiery force under DOS. Like you, I appreciate the use of standard SIMMs and the ability to easily expand my system to 32, 64 or more Mb but as long as this 640K conventional memory barrier exists, it's still a pain in the bum for real world use!

There _are_ benefits to a flat memory architecture like the Atari's.

142. New Atari Dealer Agreement

Newsgroup: comp.sys.atari.st
Date: 1993-06-03 15:11:11 UTC
From: csullogg@cc4.crl.aecl.ca
Message-ID: <3JUN93.11111116@cc4.crl.aecl.ca>
Source record: 204970

Yesterday I received a copy of the new Atari dealer agreement. Have not yet decided if I'll fill it out. Basically, the document formalizes Atari's inability to supply products on time or at all. The application is filled with phrases that basically amount to (i) you the dealer must bear all risk and (ii) if anything goes wrong - even if it's Atari's fault - it's the dealer's fault.

Never have I seen a dealer agreement for any supplier that focuses so much on absolving the supplier of any responsibility for anything. With its history of hanging dealers out to dry in the wind, this new dealer agreement is, in effect, one big statement for the buyer (dealer) to beware.

Not exacly what I expected from an organization that's only a hair away from folding.

Lately, supppiers that have sold me Atari peripherals have forwarded exclusively information on Amiga peripherals. I do not feel like singing any agreement that promises to abandon me as a dealer should anything go wrong (and with Atari it usually does) especially when other organizations that have made money supporting Atari do not even mention Atari anymore in their promotions.

Maybe it's time for a rewrite of the agreement (I suspect it's the brainchild of Bob Brodie; the king of customer satisfaction!)

See Jerry Pournelle's recent (err, last 4 months?) article on the 'ease' of memory expansion on a PC. It pays to read the technical manual that comes with your machine, so you can order the right 'type' of SIMMs... there is no 'standard SIMM' in the PC-clone world.

Note: Start saving your pennies now folks, the next level of computer gaming in the PC world is here, and it requires a fast SVGA card/monitor, a good sound card, a FAST CD-ROM drive, at least 8 megs of memory, a 486 running at better than 25 mhz, a (probably) faster I/O bus, and is called "The 7th Guest".

Problem #1: With the cash-on-hand, Atari is more likely to cease business while they're ahead than to declare Chapter 11 (or Chapter 13).

Problem #2: The Tramiel family owns more than 51% of current stock. This makes any stock purchase by user groups in order to influence company policy futile.

Problem #3: The major software houses are not interested in branching out to the non-Macintosh, non-PC market. You don't see EXCEL for the Amiga either.

Of course, some enterprising folk out there might want to contact a major software house to arrange a royalty agreement for their favorite Mac/PC software to be ported to the Atari/Amiga platforms, provide the programmers to port the software, and provide for the production, distribution and sales of the ported software. I suspect this would be a major undertaking.

LS> I am _really_ confused about something here.
LS>
LS> Why does TT030 need TT RAM?

It does not. You can use a TT with ST Ram only. (but you can't use it with TT Ram only, since screen memory and some OS data blocks have to reside in ST Ram in order to ensure compatibility)

LS> Why can't it just use ST RAM?

It can.

LS> Some TT030 users that I've talked with have 4 megs of ST RAM and
LS> 4 megs of TT RAM. Why?

Well, if you want to get the most out of your TT it is better to have something like 2 or 4 Mb ST Ram and fill up the rest of Ram memory with TT Ram, (eg. 4Mb ST Ram/4 Mb TT Ram) since the TT can access TT Ram faster than ST Ram. The TT accesses TT Ram in `burst mode] which is 20% faster than ST Ram access, which translates to programs running much faster in TT Ram than in ST Ram. That's why TT users prefer TT Ram.

I agree. The effort is a waste of time. If Atari does go bankrupt,
the best thing everyone can do is write several companies asking them
to buy the company out.

>
>Problem #3: The major software houses are not interested in branching out to

Oh, I think they would. The problem is that Atari's management is
only interested in themselves. Atari Corporation needs to believe in
"I'll scratch your back if you scratch my back."

Just imagine if Atari Corporation started scratching Atari Dealerships,
Atari Developers, Atari Users, and Atari Publications. Do you think they
will scratch Atari's back as well, yes!

149. Pagestream 2.2 and Opus - they don't agree !

Newsgroup: comp.sys.atari.st
Date: 1993-06-03 17:12:18 UTC
From: lsrbd@csv.warwick.ac.uk
Message-ID: <1ulbdilNNl7v@violet.csv.warwick.ac.uk>
Source record: 204977

Greetings Atari users, my first post to this newgroup, even though I've been following for many years now.

Someone will be able to solve this I am sure.

I obtained GDOS and meta.sys files and font files from the ST Club in the UK last year. Despite the lack of instructions, I was able to configure my GDOS font directory correctly and by getting the Opus spreadsheet (which is excellent !) program to redefine a width table (several attempts and angry cries later though !) for my Epson printer I finally got the spreadsheet to run without complaining that fonts were not loaded (even though other GDOS packages recognised that they could be loaded !).

So after nearly two years of believing metafiles were some dream, I got Opus to output one of the example charts to both my printer and .GEO and .GEM metafiles - not that I know the difference. I was ecstatic.

I ran Pagestream 2.2, imported these metafiles and was very unhappy to find that the X and Y axis (1, 2, 3, 4, etc, JAN, FEB , MAR) numbers or labels were on top of the axes lines. I thought perhaps at first that this was because of the default font which Pagescream (intentional) uses for anything that's imported (this is impossible to change, just try typing something in one font, then starting a new text box, change the font from the list and import an ASCII file - it's always in CS Triumvariate !).

Other problems with the charts I've imported are, title in the middle of nowhere near where it should be, legend text overruns the legend box.

Changing the size of imported text did not work, so I suspected that the co-ordinates for text generated in the Opus-derived metafile were incorrect. I went back to opus and altered the font size, distance from the axes (I've had it up to 10 cm away !) and always when I import resulting metafiles to pagestream the numbers on the axes overlay the axes.

SO why does this happen ? Which program is at fault ?
Is there a way around it - at present I have to ungroup the GEM/GEO metafile in Pagescream, laboriously pick the numbers on an axes holding shift, then group them, move them into the correct-by-eye position, reduce the text size in the legend box, do the same with the title, draw a band around the entire graph and then save the thing - actually I do this after I move *anything* because Pagescream is apt to decide that "hey - I don't run on an Atari ST do I so I'll just hang up for no reason whatsoever" nice course of action.

I'll bet there's a simple answer to all of this, somebody make my day !

I have heard from a friend that there is a device out that enables you to convert the modem port on an Atari to a Midi port thus giving you two Midi OUTs and a total of thirty two channels. Does anybody know about such a device. Apparently he read it in some magazine, music or Atari, but cannot remember which or where. It costs only about 30 pounds stg. I would be very grateful to anyone that could give me the proper name and where to get it by mail order.

He thinks it's called Modem Midi or something to that effect.

Paul

>assembler answered that there was no math processor. I examined the _FPU
>cookie and there is 0.
>Do I have to run any program or something to initiate the math processor, or
>do I have to change a dip switch, or something else?

Two more things:
1) Remove the jumper sitting close to the FPU slot. If there is none, ask your
local Atari dealer which resistor is to be removed.

2) Place the PAL chip you got with your 68881 into the empty socket close to
the FPU's.

If you didn't buy the 68881 from an Atari dealer, bad luck for you. You MUST
have the additional PAL to get the FPU to work.

bye, Peter

>TT RAM. Why?
>
>PC clones use the same type of memory from the first IBM PC until the 486 DX.
> Why can't the TT030 use ST RAM?

Simple answer:

The so-called ST-RAM is multi-purpose RAM, used for video display, stereo sound, ACSI output and, at last, for programs and data.

TT-RAM (Atari calls it alternate RAM) is CPU-only RAM, and is MUCH MUCH faster. TT-RAM is a great enhancement.

So, everybody will have his TT expanded with TT-RAM, because this will add memory AND speed to the system.

Finally, max. ST RAM size is 10 MB. TT RAM expansions are available up to 128 MB (in the original TT housing) and 256 MB (for tower cases).

bye, Peter

Oh now, that was strange... Last summer I upgraded an IBM PS/2 from 4
to 8 Mb. The chip installation was - as you say - straight forward.
However, the machine would *not* boot from the HD afterwards, it had
to be reconfigured with some kind of setup-floppy disk.
Note, this machine was running OS/2 2.0. Ah well, just had to say this to
defend my previous claim...

I've noticed your derogatory comments (at least I think they were yours) directed against Bob Brodie in the past. While he _has_ done and said some things which irritated me (who hasn't?), my overall experience with Bob has been a positive one. To my knowledge, he has never knowingly lied to the public about anything "Atari" and has stuck his neck out for the user on more than one occasion. I don't know what his current involvement is with dealer arrangements, so perhaps I'm operating on incomplete info. If that's the case, why don't you enlighten us (or at least me via email) about Bob?

I've always considered Bob one of the good guys at Atari. There are others at that organization who are much more deserving of our displeasure, IMHO.

Multisync monitor switchbox and cabel (this is tested and works)
""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""

If you want monochrome your monitor must handle 71 Hz frequency
NOT all monitors do this - To be sure - Test before you buy it!

Multisync side (no pin number - they depend on your monitor outlet)

Red Green Blue HorSync VertSync Ground
| | | | | |
| | | | | |
SW1---SW2---SW3-------. | | |---SW4---.
| | | | | | | |
| | | | | | | |
Red Green Blue Monochrome HorSync VertSync Ground MonoDetect
7 6 10 11 9 12 13 4

Atari ST, STE or MEGA STE side (number as in operating manual)

The switch you need must be of the type with 4 pins in that can be
switched between 2 x 4 pins out (two choices) and works like this:

Switches 1,2,3: When in color red, green and blue passes straight
--------------- through without contact with each other or mono.
When in monochrome they are all disconnected from
ST RGB and instead all connected to ST monochrome

-------- ST RGB (in color mode)
Monitor --------- SW
-------- ST Mono (in mono mode)
```

Switch 4: Open in color, monochrome detect not connected.
--------- When in monochrome monochrome detect is connected
to ground (this tells the ST it's in monochrome).

Monitor GND --------------- ST GND (always connected)
SW ------ ST Mono Detect (in mono)

Don't worry, the worst bit isn't making this - it's getting the
13-pin Atari monitor connector for the ST side and solder it !!

I have done so and found that with version 3.0.5 it is defined in linea.h as:

```
/*
* The mouse hidden flag/counter is at an undocumented negative offset
* from the structure pointed to by a0 after a linea0 (init) call.
* It is 0 when the mouse is shown.
* This is true in 11/20/85 USA rom and later, and appears to be
* true for all ROM versions of TOS.
*/
#define mousehidden *((int *)((long)la_init.li_a0-598))
```

Got a few replies on this. I will try to put it on:

ftp.cs.tu-berlin.d in pub/atari/incoming
(already tried it but my ftp session got aborted)

atari.archive.umich.edu in atari/New
(once I can get in)

So look for it there, or wait for it to be moved to a more appropriate place.

161. Atari's Jagster...

Newsgroup: comp.sys.atari.st
Date: 1993-06-03 22:06:16 UTC
From: gcl0@ns1.cc.lehigh.edu
Message-ID: <1993Jun3.220616.406188@ns1.cc.lehigh.edu>
Source record: 204986

This sounds too good to be true, both pricing and performance!
I could be a biased Amiga/Mac/IBM/UNIX box user though... :)

Sorry for the weird formatted text.

George

founder of the video game industry and the creative force behind some
of the
world's best-known titles, has announced the launch of a
revolutionary new
multi-media entertainment system, the Atari Jaguar. The launch will be
supported by aggressive advertising, promotion and marketing efforts
to be
centered in the New York market in the fall, with a national roll-out
of the
product within one year.
The Atari Jaguar, housed in a futuristic casing, is an interactive
multi-media system based on an Atari-designed proprietary 64-bit
RISC
processor. The 64-bit system is four times the technology
currently seen in
the market today. The Atari Jaguar features over 16 million colors
in 24-bit
true-color graphics and produces shaded 3-D polygons to be
manipulated in a
"real" world in real time. The Atari Jaguar also has real-time
texture
mapping and creates spectacular video effects.
The sound system is based on Atari's proprietary, high-speed,
Digital Signal

Processor dedicated to audio. The audio is 16-bit stereo CD quality and
processes simultaneous sources of audio data, allowing for very realistic
sounds, as well as human voices, which are essential for future multi-media
applications.

The Atari Jaguar is truly expandable and will include a 32-bit expansion
port which allows for future connection into cable and telephone networks, as
well as a digital signal processing port for modem use and connection to
digital audio peripherals such as DAT players.
The unit will also have a compact disc peripheral, which will be
double-speed and will play regular CD audio, CD + G (Karaoke) and Kodak's
new Photo-CD(R).
Currently, there are multiple software titles in development, which will
be available on MegaCart(TM). Atari, known for such groundbreaking 3-D

titles as
"Battlezone 2000(R)" and "Tempest 2000(R)," will issue spectacular new versions for the Atari Jaguar. New 3-D game titles will include "Cybermorph(R)," "Alien vs. Predator(R)," "Jaguar Formula One Racing(TM)" and
many more. Atari will license third-party publishers to join the Jaguar family.

"The Atari Jaguar system will revolutionize the state of home entertainment as we see it today," said Sam Tramiel, president of Atari. "The idea of a 64-bit system is earth shattering and kids and adults will be amazed at both the imagery and manipulative capabilities. And we are proud that our entry into the multi-media entertainment category will be fully made in America." The Atari Jaguar will retail for approximately $200 and will be available nationwide next year. The Atari Jaguar packaged unit will include one software experience and a Power Pad(R) Controller with a ten-key pad and other special features.

NOTE: Atari Corp. manufactures and markets personal computers and video games for the home, office and educational marketplaces throughout the world.
Atari headquarters are located at 1196 Borregas Ave., Sunnyvale, CA 94089.

Well actually you can do better than that. See the docs. 30 or even 62 character filenames are possible with the directory increment option.

>
>Why not make it the default fs for MultiTos ?

An excellent idea.

Ugh I'm not going to get away with this am I? OK I own up, I wrote the damn thing. I was planning on sending 100,000 copies of this out :-)

Several points could be made here. I'd be delighted to have it officially adopted for several reasons. Not least of which is I don't get any money for it and I'm rather short of the stuff ... In actual fact it's strictly speaking loss making if you count my phone bill.

Another reason is with the aid of developer docs and perhaps a bit of cooperation from hard disk software writers I could improve it's performance considerably by making it multi-thread.

I take it this is a reference to 0.55. I've done a lot since then
but not released much. However an interim binary of 0.60 pl2 and friends
is on atari.archive in Mint/Filesystems . The more adventurous might like
to try compiling the pl4 sources there which have a few more features.

Oh by the way theres an implementation of fsck in there too, which
does all manner of things like a lost+found directory.

Bear in mind these are pre-alpha utilities which might be buggy,
if they trash your hard disk don't say I didn't warn you (having said
that they haven't trashed mine). Bear in mind also that all I have to try
it on personally is my STE with various versions of HD software I've pulled
from the net (ICD/AHDI), the only way I can make it work with other things
is by user feedback and testing.

A binary configuration program is 'under construction'. I'm also
writing some better docs. As for future possibilities well I'm thinking
about doing a defragger and a V3 filesystem with BSD like directories; but
I'll get 0.60 out first. That is unless someone is silly/clever enough to
employ me, which might delay/cancel things.

Note: I prefer email for feedback, filtering through Usenet takes
longer than I would like. My email address has changed to:
shenson@nyx.cs.du.edu
The old address forwards there for now.

Regards all and have fun,

Steve.

IBM's Ultimedia format under OS/2 can do 24-30 frames/second of
320x200x256 animation without hardware assist. I think you're just
looking at the wrong OS/GUI combination...

Oddly enough, a new Soft Logik newsletter just arrived. Much bragging about Amiga goodies. A new deal on fonts (1000 of 'em for $500 or so) and clipart. The promise they're getting tired of repeating online in print: they WILL continue to support the Atari line. They haven't decided what to do about Atari upgrades, and WILL NOT DECIDE until after PageStream 3.0 is released for the Amiga. A couple of new (relatively) printer drivers, including DJ550C and HPLJ4.

Firstly, let me thank all those who responded to myoriginal post.
I seems that Pagestream 2.2 (or 2.2x...) is the way to go for me.

Now: Iam interested in purchasing said Pagestream 2.2 second-hand,
so if any of you are in a position where you'd like to sell
a legitimate copy to me, please contact my via email with your price.

Somebody suggested that the going price is '75 quid' 2nd hand. I'll
use this as a guide, but I am reasonably flexible.

AdvTHANKSance

As of July 1st, GEnie will no longer have an extra cost for Internet
service. I presume this means that you will be able to send mail to
anyone there regardless. Also, I believe outgoing internet mail will
be available to everyone, but I'm not entirely sure of that. This is
in conjunction with their new pricing policy.

The sheer fact that it is not built into TOS will make it difficult to
standardise anything. The same applies to NVDI which is much faster and
less buggy than TOS, yet only a minority of users have it.
MINIX does sound interesting though.

Hi folks!

I see that things on a.a are now often zipped and not zoo'ed,
or otherwise. What is a good zip/unzip to use on the ST?
I've tried stzip 2.2, but that fails for me.

Thanks,

175. Amiga DSP

Newsgroup: comp.sys.atari.st
Date: 1993-06-04 08:19:22 UTC
From: hanscs@dhhalden.no
Message-ID: <hanscs.126.739181962@dhhalden.no>
Source record: 205002

Lew Eggebrecht recently gave some more concrete information on the
DSP upgrade.

* It is a Zorro III card
* It is partly A3000 compatible
* It uses a 66 MHz 3210 DSP- future versions will use the 3207
* The separate design dramatically improves performance
* With the A4000, the DSP can share Amiga memory
* The card comes with 2Mb of memory, exp. to 16Mb
* AT+T have worked very closely with C= to port VCOS
* CBM will provide basic applications such as recording and playback
of 16 bit CD-quality sound
* Blue Ribbon are writing a version of Bars + Pipes to use the DSP
* Applications include MPEG, audio decompression, modem, speech recognition

Motorola and Atari will certainly have a hard
time beating these specs.

Well it is quite easy to beat vapourware with vapourware, if you see what I
mean: Atari says the OS includes a dsp call that decompresses JPEG files.
Turns out that was I little hard so they didn't include it in the end.
Commodore now want to look better and *claim* they can even do MPEG.
Do *you* actually *believe* them?

If the 3210 has about the same data as the 320E15 or C25 it's not very much
to talk about. The 320C25 (40MHz) has a cycletime of 100ns which would imply
about 10 MIPS (which is not true in reality). I would suspect that the 3210
is a bit better than that, and since it is running on 66MHz it has to do
at least 16 MIPS.

>Motorola and Atari will certainly have a hard
>time beating these specs.

You can't compare a DSP-card for a highend computer (A4000) with something
that is mounted in a homecomputer. And btw, the card doesn't work on a
A1200....

A nice thing about the card though is that it shares memory with the main-cpu.

I ran Minix 1.5.10 for a while. I was quite impressed with the filesystem.
I was going to take my version of Minix upto 1.6 but I have other interest
areas at the moment.

What I would like to point out that it would be nice to see Minix Fs
run which out Mint and MultiTos. I would like to beable to run a
different FS without a heavy support layer such as Mint or MultiTos.
And I am sure it is quite feasible to do this.

I am thinking about buying a computer and am wondering if
the falcon (or any computer) is able to have an electric guitar
plugged through it so that it can be used as an effects box ,and then
leads from the computer to amp or stereo output. If this is possible
is there any software which performs the effects processing ,i am not really
interested in doing it myself.

Just for fun if any one can think of reasons why i should buy an atari
mail me ,i am looking for opinions.

I would be doing
word processing (latex)
postscript viewer (ghostscript etc)
C,C++ compiling
Fax capability

and being realistic playing games

anything else i might want to be doing ?

any replies will be acknowledged

I am about to start work on my third year project :-
A program to recognise similar sound samples.(For speech recognition).

After reading through the FAQ for comp.speech I noticed there were no
references to Atari computers. Is there any source code or information
available to me specific to the Atari ST(e) or Falcon to do with the
above program ?

I got no response after posting this to comp.speech . Can anyone else help ?

Cheers for any help - Phil.

Hi !
I've found some C-programs for IBM PC for my Kawai K4.
I don't know how to use them on my Atari-ST.
These are programs for uploading and downloading K4 patches.
C programs need MPU-401 card and I want to run them no my ST.
I'd like to find some information of ST MIDI ports !

Thanks in advance !
Kormo.

Check out page 58 of the February '93 issue of Byte magazine. There is a little review of the Falcon and the guy that did the review did just that. He plugged a guitar into it and did various things without any additional hardware (besides the guitar, cord, and pick). I think he also was using Audio Fun Machine (software, comes bundled with the Falcon).

Unlike the Amiga, ALL of the Falcons will have a DSP. Falcon software will be written to assume that the DSP exists in the machine, allowing all Falcon users to take advantage of the benefits of the DSP (not just the few who decided to buy a DSP card).

Strange... Video for windows only makes 15 frames/second at 160x128x256 on
a 50MHz 486. Why the difference? These values very found by a real
test - not what the distributors say. Until now I never have seen that
OS2 is that much faster than windows.

Hmmm,
you have to take into account the CPI - rate, too. I heard that the 68020 takes 6 cycles per instruction (average). The 68000 performs probaly worse. The 80486 is reported to reach an integer CPI-rate between 1 and 2 - therefore getting into RISC-levels (Intel claims to have build a "RISC core"). Regarding this and the clock rate, CPU power is obviously lost somewhere in the 486 machine.

Then you should be mad at Atari, not Bob Brodie. He is just doing his
job. He is a spokesman for Atari. It's his job to relay what his
bosses tell him to tell to the public.

Personally, I'm a little tired of seeing hard working Atari employees
get blamed for things that are beyond their control. For example, in
the past, I've seen Atari engineers get flamed for Atari's lack of
advertising. Like they have anything to do with that...

Source record: 205019
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

The HSC MiNTlibs are progressing nicely, and may well be ready for release by tomorrow [if I can keep the compiler stable long enough to build them -- ah, the joys of beta-testing ;)]. In the meantime, I've uploaded to atari.archive some tools I've built and/or accumulated and have been meaning to make available:

cdecl.zoo
A straightforward port of Unix cdecl, an amazingly useful tool for deciphering cryptic C declarations to readable English, or vice versa. For instance, you can ask it to:

explain void *(*fred[5])(int, const char *)

and it will reply:

declare fred as array 5 of pointer to function (int, pointer to const char) returning pointer to void

cpp.zoo
A stand-alone C preprocessor, handy for compilers like HSC which don't allow direct access to output from the preprocessor stage. To the extent of my ability to make it so, it is entirely standard-conformant, including the concatenation and stringizing operators.

mit2mot.zoo
A bit more esoteric, this program translates assembly code in MIT syntax (as produced by GCC) into the more common Motorola syntax expected by most other assemblers. This is a simplified version of the gods-awful asm_pp hack I included with pl25 of the HSC MiNTlibs; all the functionality of the latter and more is now provided with the former in combination with cpp.

Enjoy. With luck, I'll be back soon with the HSC MiNTlibs.

Yes, Musicom (Compo) does it and Cubase Audio will do it soon. I am sure
that some stuff will appear in the PD as well. Bare in mind though that
none can do more than one effect at a time at present.

Has anyone managed to do JPEG decompression with the DSP?

Couldn't tell somebody Microprose Uk to get an e-mail account by themself?
It seems that Microprose Us hasn't any idea which things Microprose Uk
publishs/sells/...
And they haven't even seen Civilisation for the Atari. They have no idea
which games they (MPS) produce for the atari.
A real bad joke!
Any help?

Matthias

Message-ID: <4JUN93.16112393@cc4.crl.aecl.ca>
Source record: 205028

A month or two earlier, I posted extracts of a FAX Brodie sent to me. As a dealer, I had complained about Atari failing to fill an order I had placed. I asked him, as director of communications to PLEASE look into the fact that no one at Atari was responding to my requests for information about the status of the order. Brodie replied that my request was arrogant and insulting (remember, I asked him to PLEASE look into the matter) and that I could expect to be put on the bottom of his priority list if I made another "arrogant" request.

Since I posted the info about my exchange with Brodie, I have made approximately a dozen requests for information about my status as a dealer. I asked for info from Shirley Taylor, Bob Brodie and even Sam Tramiel. After a dozen or so FAXes, not ONCE have I received any reply from Atari. So you see, because I had the nerve to ask for the status of my order and because I had the nerve to take offence to Brodie's threats to stonewall me because I was harassing Atari (I guess he's not used to seeing the use of PLEASE and thought I was being sarcastic), Atari appears to have blacklisted me. They absolutely refuse to communicate with me at all. I have had to advise clients to go elsewhere.

One client has come back asking for my help. I told them Atari would not deal with me and to contact them directly about a Portfolio bus connector. After a week of run arounds by Atari, the client asked me to intervene on his behalf. So, we have a case of a client begging for product info and getting no where with Atari. As for me, I am apparently black listed (seemingly by good old Brodie) and as such I posted that little shot about him and customer satisfaction. Therefore, John Hutchinson, you have your justification for my "derogatory" comment - I think it is well deserved. if Brodie worked for me as director of communications and sent a dealer a FAX like the one he sent me he would have been out on the street immediately. Nuff said!

] Then you should be mad at Atari, not Bob Brodie. He is just doing his
] job. He is a spokesman for Atari. It's his job to relay what his
] bosses tell him to tell to the public.

True, but some of the info must be really blindly-relayed as some it is
ludicrus!

] Personally, I'm a little tired of seeing hard working Atari employees
] get blamed for things that are beyond their control. For example, in
] the past, I've seen Atari engineers get flamed for Atari's lack of
] advertising. Like they have anything to do with that...

What they do, they do well!

Some of the ideas are pretty mindless however. Where was their marketing
division trained? Siberia? I'm surprised that most dealers don't just
point-blank refuse to deal with Atari with that kind of dealer agreement,
(as mentioned, before "If it's Atari's fault, it's the dealers fault
anyway...) Their not packaging promised goodies with the machines, and/or
giving people grotty photocopied manuals instead of proper ones, better
than nothing, but this *is* a commercial company!)

I've just about had it with this machine, I can't get software for it,
the bugs in the OS are REALLY getting annoying (I've even found a
good way of locking up the desktop, even without TSR's!). Those
STUPIDLY placed Mouse/Joystick ports. Low-resolution graphics mode
(surely, even in '86 they could have gotten something better!), Single-
Tasking OS (which still requires around 150k of my RAM),
I like using the machine, (Great software like FreeZe-Dried terminal,
LDW-Power, First-Word+ (Old but good, none of this stupid variable
font crap that really stuffs up tabulations etc.) But unless this
Falcon opens up a local dealer for me to get some ST software, I'll
have to try and find a machine with some support.... (Heck, even
an amoeba would be better, although they are heading the same way
as Atari over here, and that A1200 has flicker lines almost half-a
centimetre out. It's terrible! (Worse Hardware flicker than the ST's
software flickering to get those 4096 colors!)

The only thing that's kept me in the Atari-world, is the brilliant
Shareware and Public Domain software that people write. Some of it
really is brilliant!

Message-ID: <1uojfv$4f1@usenet.INS.CWRU.Edu>
Source record: 205033

I'd like to know what the hell is going on??

ATari is asking stockholders to vote on a 1-for-10 stock split.

That means if you have 1000 shares, you will only have 100 after this split.

The value will remain the same, but if you only have 100 shares and each share goes up .25 cents, you only make so much. If you have 1000 shares and each share goes up .25 cents, you make a hell of a lot!

Atari claims that people and company don't want stock that low and they think if they force it to go up, it will be different.

Unforunately, Atari's management made it go that low in the first place and who is going to be paying for it now? Investors.

No, a 1-for-10 reverse stock spit will not work.

Len

> i486DX2-66 MS Visual C++ 1.0 1.63
> 16Mhz 68000 Gnu C++ 2.1 22.33

I was running Dhrystones on my PC today to see what the various memory models and 80?86 code options would do. Using GCC, with -mshort -O on my ST, I got 677 dhrystones/second. That was the best result I managed to get.

On the '486/33 I got anywhere from 12500-50000 dhrystones/second (18x-74x faster than the ST) depending on OS/memory model/CPU-specific (the best results came from "Tiny" model with 80286 code under plain DOS; Micro$oft C won't create 80[34]86 code).

I'll be taking the dhrystone code I used on my ST in to work on Monday for more accurate results; I'll even try it on a heavily loaded unix system ('486/33 I think).

[garbage deleted]

Ofir, I first ran across your GemBench program about two months ago.
I tried to email you to compliment you on a fine program and offer some
suggestions for future version of GemBench. I last updated Quick Index
several years ago and have no plans to update it in the future, so it
doesn't hurt to have someone else add features to their benchmarker.
However the mail bounced back and I forgot about the matter until I saw
your rather insulting posting here on the net.

First of all, your accusations in your GemBench docs are completely false.
I don't know about the benchmarking software included with Turbo ST since
I was not involved with it, but I can certainly tell you that Quick Index
IS NOT and NEVER WAS IN ANY WAY modified to give Quick ST or any other
accelerator any sort of preferential treatment in order to give higher
benchmark figures. You make that claim in your documentation without
a shred of proof and obviously you never made the effort to check your
accusation.

First of all, check your history bozo. Quick Index was release in early
1988, over 5 years ago. The subsequent updates to Quick Index added
additional benchmark references, such as the STE and the TT. The benchmarks
themselves were not modified and that was documented.

Secondly, Quick ST, or the Mega ST, or the blitter, or the Falcon, or
NVDI, or the TT didn't exist at the time Quick Index was first released.
So there is no way that the benchmarks could have been "fixed" considering
that in 1988 I hadn't even written Quick ST or even knew about the various
accelerators that were to come over the next 5 years. The main reason I
wrote Quick Index at that time was to benchmark the difference between the
8 Mhz Atari ST and the rumored 16 Mhz accelerators boards which also did
not exist at the time.

Third, if you don't give a rats ass about the VT52 benchmarks, then don't
use them! Duh! You are correct to say that more GEM software does not use

VT52 output routines. No shit Sherlock! That's why I have separate benchmarks for VT52 and GEM. Scrolling is also separate, because while you may not care about it, it does give a good indication of the computer's memory blitting (copying) speed. The program Turbo ST originally only gave big speed increases in VT52 output and not GEM output. The benchmark program provided with it only tested VT52 and ignored GEM. When I got Turbo ST and ran it through my Quick Index I saw that GEM speedups were almost non-existant, thus one motivation to write a program like Quick ST and blow Turbo ST out of the water. I'll continue this point in a few paragraphs.

Four, GemBench is equally guilty of benchmarking some things that are never or rarely ever used by GEM programs. Inquire functions are something that get called maybe one at initialization time and then probably don't get called again during the execution of a GEM program. So how fast an inquire function executes is totally irrelevant to how fast a program repsonds to a user.

Five, and this is the most important point and the reason why I'm flaming you at all, the benchmarks in GemBench are for the most part totally useless and inviting abuse. Let me explain.

If I'm writing a screen accelerator such as Quick ST or NVDI, it is in my best interest to get as high benchmark numbers as possible on a program such as Quick Index or GemBench. Now if the benchmark program does something only test a small number of screen operations (such as only VT52 text or only a certain type of graphics operation) then I am going to optimize my accelerator to only speed up those things and thus achieve incredible speed benchmarks. Turbo ST did this to string output, suddenly getting speeds of like 1200% for string operations. I played along and did the same thing in Quick ST with similar numbers. So if you argue that the Quick Index number for string operations is somewhat meaningless you are correct because the screen accelerators can "cheat". However in all fairness the string output code in TOS is quite brain dead and a benchmark of 500% without cheating is quite doable.

I anticipated that people might try this (after all, it is done all the time with VGA boards and VGA benchmarks, just look at some of the outrageous claims). So for the VT52 benchmarks I made them so that they continually change the screen output, such as changing the character being printed or the string being printed. For the GEM Dialog benchmark you may notice that the dialog box is shifted to the right by several pixels each time it is redawn. This forces the graphics output routines to handle not only byte aligned text but also byte unaligned text.

Another utility I included with Quick ST was BMVGTEXT.PRG, which benchmarks v_gtext in much the same way that GemBench does. However, BMVGTEXT shifts the text continually for the same reasons I mentioned above.

Now, we get to GemBench. I don't disagree with your choice of benchmarks. It is a good mix and again I compliment you on the design of the user interface. However, each one of your benchmarks does pretty well the same thing: draw something, erase it, draw it again in the exact same screen

position, and repeat that a bunch of times. HOW STUPID!!!! If I wanted to, I could write a screen accelerator that is optimized for your particular benchmarks and get amazing numbers while in real life the accelator could be pretty useless. Your v_gtext benchmark draws the exact same text in the exact same position over and over again. WIDE OPEN FOR CHEATING. It is done all the time with VGA cards and people are finally catching on to it.

So, my advice to you Ofir, is that before you go around accusing someone of wrongdoing, check your facts first. And secondly, change your benchmarks to _REALLY_ test the screen routines.

Finally, the reason I was looking at your program at all is that for my Gemulator program I include Quick Index to allow people to benchmark Atari ST emulation on the PC versus the real ST. I was told about your program by one of my users and I tried it out with the belief that maybe your program would offer a wider array of benchmarks. It does, but as I've spent 10 pages telling you, they're bogus. Go fix them and I'll be glad to include your program with Gemulator.

- Darek

TOWNS [John] at 19:39 EDT

Well, folks.. Your wishes have been answered:

OTC 06/03 1552 ATARI LAUNCHES THE JAGUAR, A 64-BIT MULTI-MEDIA GAME SYSTEM

SUNNYVALE, CA (JUNE 3) PR NEWSWIRE - Atari Corp. (AMEX: ATC), the founder of the video game industry and the creative force behind some of the world's best- known titles, has announced the launch of a revolutionary new multi-media entertainment system, the Atari Jaguar. The launch will be supported by aggressive advertising, promotion and marketing efforts to be centered in the New York market in the fall, with a national roll-out of the product within one year.

The Atari Jaguar, housed in a futuristic casing, is an interactive multi-media system based on an Atari-designed proprietary 64-bit RISC processor.

The 64-bit system is four times the technology currently seen in the
market today. The Atari Jaguar features over 16 million colors in 24-bit true-color graphics and produces shaded 3-D polygons to be manipulated in a "real" world in real time. The Atari Jaguar also has
real-time texture mapping and creates spectacular video effects. The sound system is based on Atari's proprietary, high-speed, Digital Signal Processor dedicated to audio. The audio is 16-bit stereo CD quality and processes simultaneous sources of audio data, allowing for
very realistic sounds, as well as human voices, which are essential for
future multi-media applications.

The Atari Jaguar is truly expandable and will include a 32-bit expansion port which allows for future connection into cable and telephone networks, as well as a digital signal processing port for modem use and connection to digital audio peripherals such as DAT players.

The unit will also have a compact disc peripheral, which will be double- speed and will play regular CD audio, CD + G (Karaoke) and

Kodak's new Photo-CD(R).

Currently, there are multiple software titles in development, which
will be available on MegaCart(TM). Atari, known for such groundbreaking
3-D titles as "Battlezone 2000(R)" and "Tempest 2000(R)," will issue
spectacular new versions for the Atari Jaguar. New 3-D game titles will
include "Cybermorph(R)," "Alien vs. Predator(R)," "Jaguar Formula One
Racing(TM)" and many more. Atari will license third-party publishers to
join the Jaguar family.

"The Atari Jaguar system will revolutionize the state of home
entertainment as we see it today," said Sam Tramiel, president of Atari.
"The idea of a 64- bit system is earth shattering and kids and adults
will be amazed at both the imagery and manipulative capabilities. And
we are proud that our entry into the multi-media entertainment category
will be fully made in America."

The Atari Jaguar will retail for approximately $200 and will be
available nationwide next year. The Atari Jaguar packaged unit will
include one software experience and a Power Pad(R) Controller with a
ten-key pad and other special features.

Atari Corp. manufactures and markets personal computers and video
games for the home, office and educational marketplaces throughout the
world. Atari headquarters are located at 1196 Borregas Ave., Sunnyvale,
CA 94089.

From: mgm@world.std.com
Message-ID: <C84u1B.5C3@world.std.com>
Source record: 205036

hutch@bellman.lanl.gov (John Hutchinson) writes:

>Hmmmm... yeh, I knew about the new rates ($3/hr) but I thought one still
>had to sign up to accept the Internet access and that it would still be just
>one way (Internet->GEnie). I've sent mail to Darlah and asked for some
>clarification and will post her reply here.

Even now, it isn't just one way. This is from the "about internet
mail" selection in the Internet RT on GEnie:

>If you are acquainted with the GE Mail system, GEnie's Internet Mail Service
>should be easy for you to use. Messages may be sent either through the TTY
>front-end provided on page 207 or from the GE Mail Command Mode. For
>instructions on sending a message via GEnie's Internet Mail Service, select
>item #3, "Internet Mail Instructions," on page 207.

And the next bit is from the announcement of the new pricing:

> 1. There will no longer be additional charges or registration fees for
> Internet mail gateway use.

I think that makes it reasonably clear.

215. Spelling and context checkers compatible with ST Writer?

Newsgroup: comp.sys.atari.st
Date: 1993-06-05 06:25:02 UTC
From: jamesl@cie-2.uoregon.edu
Message-ID: <1upe7u$t73@pith.uoregon.edu>
Source record: 205039

The title pretty much says it all. Does anyone know of any PD spelling checkers or context check programs that are either compatible with ST writer files or at least can work with ASCII files on the 1040 ST?

Thanks...

Sorry, Glen.. you lose..

Buying OS/2 to "run Windows aps" buys you a lot more than just Windows 3.1

If you want to know just what it buys you, there are plenty of OS/2 newsgroups that can teach you...

If all you want to do is go "teh heh I'm too superior to want to learn anything" then you're in the right place.

There are far more OS/2 applications than there will ever be for the STe or the Falcon, and with IBM's enlightened posture towards developers, there will be far more than that to come.

My "main putdown" about Ataris is that the people who make them have far less concern for them than we have.

BobR

218. Re: PC memory -- Atari memory

John, the "conventional memory" problem only exists for DOS programs.. and OS/2 helps manage the available memory a lot more effectively than most other solutions.

This particular session of DOS under OS/2 sees 604,304 bytes of "conventional memory" free, and that's including the overhead of QModem Professional after Exiting to DOS to run MEM. This session shows 2 megabytes of Extended memory and 2.5 megabytes of Expanded memory available, but only because those are the recommended defaults per each DOS session. EACH sessioon...

I can run multiple DOS sessions concurrently, and multitask all of them with both multiple Windows 3.1 sessions AND native 32 bit OS/2 sessions.

My actual virtual memory is only limited by the size of my hard drive.

The point is, harking back to the old "640K" limits of the original IBM PC is a little like saying the Atari 8 bit computer is crippled because it can't execute a program bigger than 48K...

That was true then.. but this is now..

BobR

Ah.. I *knew* I could count on you, David..!

The machine you described won't cost much more (if more at all) than an Atari Falcon... and is available NOW..! at computer stores EVERYWHERE..!

"The 7th Guest" is *Today's* software... not RSN.. whenever the rag-tag few remaining Atari developers can manage to come up with something on "spec"... hoping that they might sell a dozen or so copies to pay for the beer it took to develop the program..

Before you get too apoplectic, please do me the courtesy of remembering that all I posted was how easy it was to expand the memory of my PC to 8 megabytes...

(While you're foaming, why not post the names of a few.. well, maybe just a couple.. or .. ok... how about just one... Falcon game that comes close to "The 7th Guest"... OK.. well, something easier.. how about a Falcon game that's better than "X-Wing, The Star Wars Flight Simulator".. oh.. well, OK... then how about a Falcon.. or heck.. even an ST game that's better than "Eye of the Beholder III"... come on, I know you can do it..)

Erling, you're right.. the PS/2 models have to have a configuration file for every option you want to add..

I like to think of them as the "TT" of the "pc" world..

The PS/2 was IBM Corp's attempt to control their market, much like Atari Corp. has tried to control their own market.

Luckily for the PC world, that attempt was not successful.

There are far more "easy to expand and configure" clones in the PC world than there are "True Blue" crippled (er.. much like Atari's line) computers.

No, I've read all of it, 90% of it has been slinging abuse at people
merely for stating their views of what was correct. A simple
'No, that's not right', rather than a 'don't be an idiot etc.' attitude
might be a lot easier to read!
```

: >no expensive proprietary "daughter boards" that are available from only
: >one source, and difficult to obtain sometimes, no "designed in"
: >4 megabyte limit. I simply rebooted, and the system saw 8 megabytes of
: >memory. ...

: Hmmmm, I'd wager that from DOS your system didn't automatically "see" 8Mb of
: _conventional_ memory, Bob. Sure, OS/2 and Windoze helps isolate the user
: from memory partitions, but it's still there in full fiery force under DOS.
: Like you, I appreciate the use of standard SIMMs and the ability to easily
: expand my system to 32, 64 or more Mb but as long as this 640K conventional
: memory barrier exists, it's still a pain in the bum for real world use!

Um...how many people do you know who use DOS very much anymore? Personally,
I run unix and OS/2 on my 486 machine at home. When I upgraded to 8 megs
and then to 16 megs, it was just a matter of cycling the power and VOILA,
the new memory was recognized and ready to use.

You are essentially ragging on the PC world because of limitations on
their 1st and 2nd generation machines/software. Well, I hate to break
it to you, but the majority of PC users have left the 8086/286 (and
even the 386) behind. Now that unix, OS/2, NT, NexStep, and other more
sensible operating systems are available for the pc, I think you will
see people DEMAND that the farce known as DOS+Windows toe the line
or lose market share.

What exactly am I getting at here? :) While many pc architecture people
are currently bitten by the 640k limit, they can easily make it go
away by purchasing any number of other OS's that don't have this
limit. I currently have OS/2 up on my machine, and I am playing
Xwing in full-screen DOS mode, downloading a file from a VAX using
kermit in an OS/2 window, and have AMI Pro 3.0 running with my
girlfriend's term paper up in a Win-OS/2 window.

The silly limits which you keep espousing as evil pc-isms will
probably linger on for those who don't want to get a real OS,
but to lump all intel boxes into that mold seems rather silly,
at best, and intellectually dishonest, at worst.

Cheers,

Chris

It can? I always thought you needed a Multisync to do that, and even
then a Multisync that is capable of low scanrates (something like
15kHz). I always thought VGA is 31 kHz. How is this done with a
VGA-monitor? And if this is true, what are the advantages of a
Multisync to a VGA monitor when used with a Falcon? Do all the video
improvers work with VGA (Screenblaster, Blowup etc.)?

Isn't it said how things are changing?

Atari users were once noted for helping out Atari users with any questions
that they may have.

Now, it seems like things are changing around.

But, there are still many good Atari users out there because I did receive
the answers to my questions. And the people that gave me the answers
went out of their way to do it (which I appreciate greatly).

It seems a little strange to me that Atari would announce the Jaguar
64-bit video game system, but not appear at the Summer CES.

Why would anyone announce a product that they don't have to show anyone?

It is like me announcing that I invented a device that will make
me disappear, but then say it won't be available until next year.

Has Atari showed the Jaguar publicly, does anyone know?

Anywhere?

THIS is the kind of marketing strategies that leaves me wondering if there
is _ANYONE_ in charge of marketing at Atari.

Len

Not strange at all. Look at it this way -- how much would it cost to reserve
a booth for four days at the Chicago CES, and send a crew of folks to show off
existing (Lynx) products?

Now how much would it cost to put out a press release? Especially to the
network of computer systems?

No, it's not the same -- "you get what you paid for". But it makes sense, in
an odd way that emphasises savings over exposure.

>Why would anyone announce a product that they don't have to show anyone?

So you know they're out there.

>It is like me announcing that I invented a device that will make
>me disappear, but then say it won't be available until next year.

I think the idea is to convince people that the Jaguar is a viable system,
if you're willing to wait a bit longer and not bother with the 3DO/SNES CD/etc.
You know, "Why should I get a SNES CD when I can get the Jaguar in six months
and blow the doors off it?"

The problem is that I don't think this tactic works. Yes, Atari has some
really nice stuff available/coming soon. Problem is, either (a) by the time
it's released, it gets eclipsed by a competitor, or (b) when it is released,
the lack of promotion leaves it to languish and flounder.

>_THIS_ is the kind of marketing strategies that leaves me wondering if there
>is _ANYONE_ in charge of marketing at Atari.

Len, are you new here? B-)

--R.J.
B-)

P.S. I'm still trying to decide which is worse: Warner-owned Atari Inc., with
internal fratricide where one division shot another division in the foot. Or
the current management of independent Atari Corp., where they try to run
high-tech hardware on a shoestring budget.

You only need a multisync to display truecolour with more than 320*480.
Screenblaster and BlowUp030 work fine with a VGA. The author of BlowUp030
is probably reading this and should be able to give you further info.

An SVGA copes with all ST resolutions plus:

640*480*2
640*480*16
640*480*256
320*240*truecolour
320*480*truecolour

Plus other less useful variations of the above.

Friday Night Special Edition Real Time Conference
June 4, 1993

Dateline Atari! with Bob Brodie

Host - Lou Rocha

<[Lou] ST.LOU> Welcome to the June installement of Dateline Atari!
with Bob Brodie, Director of Communications for Atari Corp. We are
indeed privileged and appreciative to have Bob participate in this
exclusive monthly conference with Atari users here on GEnie. As
June flowers begin to blossom, Atari users are posting news of
Falcon purchases. In the Bulletin Board there are daily messages
from ecstatic new owners. New Falcon topics are opening as
software notes are shared and compared. There is a very definite
upbeat mood in the Atari ST RoundTable now that the Falcons have
arrived in large numbers. If that were not enough, we have heard
that the 65 meg hard drives have been upgraded to 80 meg units at
NO EXTRA COST! I guess that is the reward for being patient :-)
Tonight, Bob has returned to bring us the latest news on Falcon
availability. He will also give GEnie users the first official
announcements about Atari's newest product. Bob.... the curtain is
rising.

<BOB-BRODIE> Welcome to the June '93 edition of Dateline Atari!
Settle back into your chair for a few minutes. Make sure you have
your capture buffer turned on, or be sure to go to the library
tomorrow morning to d/l the transcript from tonight's session;
I've got lots of info to share with you tonight!

First, I'm pleased to announce that shipments of Falcon030s are
continuing with units for dealers to sell at this point. We
presently have over 140 (yes, that is One Hundred Forty) dealers
on board, in over 40 states. This is much better than where we
were a year ago. We're very pleased that our decision to go with
the new dealer agreement has brought us leverage to bring on new
dealers! In fact, earlier today I got a call from one of our
```

"holdout", older dealers that hadn't signed the agreement yet. He's having a change of heart, and I'm looking forward to him carrying Falcon030s. This is a very good sign!!!

Also, we're pleased that we've brought on board another of our longtime partners, Pacific Software Supply, to be a distributor for the Atari Falcon030. We will be working very closely with them to ensure that the dealers that they sign up meet all of the criteria that we have established for Atari dealers. All of the dealers that Pacific Software brings on board will be signing the same dealer agreements as the dealers that we deal directly with.

Of course, this means that Pacific is now also carrying a host of accessories for the Atari Falcon030 as well, like the sometimes elusive SCSI-II cables, a host of Falcon software, VGA monitors, and lots of other goodies for our dealers. In short, the dealers are getting another terrific resource to work with!!

Some of you may recall that I indicated in the last Dateline Atari! we were still a ways off from being able to ship SpeedoGDOS and MultiTOS to existing Atari owners. Both of these products are shipping with Falcon030s. Today we received the diskettes back from the duplicators, and the manuals arrived a couple of days ago, so we're actually ahead of schedule at this point! We have begun assembling the packages so our customers will be able to purchase MultiTOS and SpeedoGDOS along with 14 BitStream fonts within a couple of weeks!!!

The manuals for Atari Works have still not arrived, which means that we are still ON SCHEDULE <grin> for that product. Works should be in stock in approximately fourteen more days.

The retail price for the products to current users has been slightly adjusted, and is now as follows:

SpeedoGDOS - $64.95
MultiTOS- $59.95
Atari Works- $118.95

We have also done an incremental upgrade to the Atari Falcon030 in our on-going efforts to provide our users with the best units we possibly can. We have upgraded the Atari Falcon030 from a 65 meg internal hard disk drive to an 80 megabyte hard disk drive. We were able to secure the new mechanisms at the very same price as the 65s, so there will be no increase in price to our customers!

Currently, Atari Falcon030s are shipping with the following programs on the drives:
MultiTOS
SpeedoGDOS
Landmines
Breakout
CalAppt

ProCalc
Talking Clock

They are also *supposed* to have on them Atari Works, System Audio Manager, Audio Fun Machine, and FalconD2D. A small number of machines got out the door without these programs installed on the drives. We will be shipping a mail-in card to the dealers that got these machines a card for their customers to mail into Atari so you will receive these products via mail. We apologize for the mistake.

We are now in anticipation of another shipment of Falcons in about two weeks. Included in this shipment is going to be a number of units that will not have hard drives built in, specifically the Falcon030 with one meg of RAM and no hard disk, and with four megs of RAM and no hard disk. These units WILL NOT come with SpeedoGDOS, Atari Works, or FalconD2D. They will have everything else, including the hard disk utilities in case you have your own SCSI hard disk. We will be selling at a later date a hard drive upgrade kit, which will ship with Atari Works, SpeedoGDOS, FalconD2D, MultiTOS, etc. on the hard drive.

Regarding applications for the Atari Falcon030, Bill Rehbock has passed on to me some information concerning products and availability. Please understand that I am not professing literacy in all (or for that matter, any) of these products. I am simply passing on some interesting information to our users. I hope that this will prove encouraging, and help demonstrate that the interest for Atari Computers is continuing to grow. In several cases, these applications will not only run on the Falcon030, but other Atari computers as well. Where I have commented about who will be carrying the product in North America, this is based on the best information I have at this time, and is subject to change.

Interface, a programming tool, from SHIFT GmbH, carried by Gribnif.

As you can see, there really is a lot going on!!!

In addition to all of that, we've been busy on the game side of things as well! We're ready to release three more titles for the Lynx: Gordo 106, Lemmings, and Jimmy Connors Tennis. I've seen eproms of these titles, and expect to have news on production in the near future.

Also on the game side of things, as CES is going on in Chicago even as we speak, we've announced the Jaguar, our oft discussed new game machine. For those of you who haven't had a chance to hear about the Jaguar, here is our press release:

Atari Corp., the founder of the video game industry and the creative force behind some of the world's best-known titles, has announced the launch of a revolutionary new multi-media entertainment system, the Atari Jaguar. The launch will be supported by aggressive advertising, promotion and marketing efforts to be centered in the New York market in the fall, with a national roll-out of the product within one year.

The Atari Jaguar, housed in a futuristic casing, is an interactive multi-media system based on an Atari-designed proprietary 64-bit RISC processor. The 64-bit system is four times the technology currently seen in the market today. The Atari Jaguar features over 16 million colors in 24-bit true-color graphics and produces shaded 3-D polygons to be manipulated in a "real" world in real time. The Atari Jaguar also has real-time texture mapping and creates spectacular video effects.

The sound system is based on Atari's proprietary, high-speed, Digital Signal Processor dedicated to audio. The audio is 16-bit stereo CD quality and processes simultaneous sources of audio data, allowing for very realistic sounds, as well as human voices, which are essential for future multi-media applications.

The Atari Jaguar is truly expandable and will include a 32-bit expansion port which allows for future connection into cable and telephone networks, as well as a digital signal processing port for modem use and connection to digital audio peripherals such as DAT players.

The unit will also have a compact disc peripheral, which will be double-speed and will play regular CD audio, CD + G (Karaoke) and Kodak's new Photo-CD(R). Currently, there are multiple software titles in development, which will be available on MegaCart(TM). Atari, known for such groundbreaking 3-D titles as "Battlezone 2000(R)" and "Tempest 2000(R)," will issue spectacular new versions for the Atari Jaguar. New 3-D game titles will include "Cybermorph(R)," "Alien vs. Predator(R)," "Jaguar Formula One Racing(TM)" and many more. Atari will license third-party publishers to join the Jaguar family.

"The Atari Jaguar system will revolutionize the state of home entertainment as we see it today," said Sam Tramiel, president of Atari. "The idea of a 64-bit system is earth shattering and kids and adults will be amazed at both the imagery and manipulative capabilities. And we are proud that our entry into the multi-media entertainment category will be fully made in America."

The Atari Jaguar will retail for approximately $200 and will be available nationwide next year. The Atari Jaguar packaged unit will include one software experience and a Power Pad(R) Controller with a ten-key pad and other special features.

We did not show the Jaguar on the floor of CES. We have a videotape demonstrating the units capabilities that we are showing to developers and key retailers. We have been shipping Jaguar developer units for awhile now, and are very excited at the reception of our new unit.

Rather than invest in an incredibly expensive rollout at CES, we've opted for a "special event" kind of rollout. We will conduct our event at a date to be announced in the fall.

We are extremely excited about this project!!!! It has been much awaited by all of us in Sunnyvale, and we forsee it as a product that will recapture the attention of consumers throughout the world!! I've been pleased that already, in less than 24 hours after the press release has hit, a number of publications (even the foreign ones!) are calling in, and looking for as much information as possible. For the most part, we're sticking with the press release at this time. We will release specification sheets at a later time.

One thing that I know the Tramiels are particulary excited about with this product, is that it will be an American prodcut, manufactured in America! I hope that all of you share our enthusiasm for that!!!

With that, I'm ready to filed any questions that our members might have tonight, Lou. Let's talk Atari!!!

<[Lou] ST.LOU> Thanks Bob. It does sound like more good news! Here come the hands.....:-) Our first guest in Charlie Townsley.

<[Sexy] ARCHIVIST> Hi again Bob, thanks for being here. A little question about the pricing of the new programs from Atari: You quoted Atari Works as having a price of $118.95, does this include SpeedoGDOS as was suggested earlier? Or is Speedo extra at at the price of $64.95?

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

HELP ME! I have about a million questions about GNU C and MiNT.
For instance, how do I use the MiNTLIB instead of the standard libraries?
How do I know I have the latest archives? What are the updates directory
for? What are the GNU things in the MiNT directory for? How do they
differ from the archives in the GNU directories (on a.a.u.e). If I want
to use GNU C to compile UNIX programs for MiNT and TOS what is the best
way to do this? And what type of UNIX system should I compile for (sys V,
BSD, etc.). What are the naming conventions for the libraries, because I
want to delete all the archives except for the 16 bit 68000 and 32 bit
68020, not the other combinations. How do I specifiy the libraries? Will
GNU C choose the proper variations?

Anyone know how to use GNU C as a cross-compiler for generating 80x86 code?

Thanks, please send any help to evanlang@sdf.lonestar.org

I've also found that the CyReL Serial Mouse Manager (from Cybercube,
makers of the CyReL Sunrise M-16 graphics card) dies a horrible death
under MiNT (and thus, MultiTOS).

As a major oversight, SpeedoGDOS does not come with a PostScript drive.
It doesn't have CPX modules to configure it either, just a couple of
largish ACCs.

No. Someone always asks about it though. Write a letter to Atari and ask
them for PS support. They're still upgrading the program from what I hear.

>64-bit video game system, but not appear at the Summer CES.

It's less expensive to distribute a press release than it is to haul
people and equipment to a show just to say, "Hi!"

>Why would anyone announce a product that they don't have to show anyone?

As if this hasn't been done before....? Many, many corporations advertise
without really advertising a product. The oil companies do this a lot on
TV, how they protect the environment, etc. AT&T is doing this now with their
future technologies advertising. None of those are products, but it keeps
the company in the limelight. 3DO =barely= has a product, and yet look how
much press they've been getting lately.

>Has Atari showed the Jaguar publicly, does anyone know?

No, just to developers, which is a good idea.

I know it is very likely that no one, or at least very few, people who have Atari ST's still use NEOchrome. Yet, for people like me, with young children, it's a hard paint program to beat.

Anyway, I remember hearing that there is an undocumented feature in NEOchrome (at least by version 1.0 it was still undocumented) in which you could get an additional painting feature, which looked like a movie camera in the paint selection box. (You get it by selecting the Grabber option. Then go the the second "R" in the word "GRABBER" and click on it.) I'd like to know how to use it? Does anyone know how, or have some documentation on it?

From the Saturday June 5, San Francisco Chronicle:

"Friday, 2 pm.

"After several hours of checking out gadgets and rumors, it seemed fitting
to wind up with Atari Corp., the company that invented the video game.
Now dwarfed by Nintendo and Sega -- and out-hyped by 3DO -- the company is
not giving up.

"Sharing space in a tiny booth, Vice President Gary Tramiel plays a tape
of a new machine called Jaguar that Atari hopes to launch close to
Christmas in San Francisco and California. It is the first system to
promise 64 bits of computing power -- twice as much as personal computers
or 3DO systems -- and Tramiel says it will cost just $200."

This should be interesting. :-)

Incidentally, Len...

To answer your question about whether faster Falcons would make your games unusable, it depends on the techniques the programmers use to implement the delays needed to make the games run..

One problem in the Atari world is that development of the machines has traditionally been so stultified that programmers have come to assume that the current situation will exist forever..

An example is the early games and programs that broke when people started upgrading their STs from 512K to 1 Meg... the programmers assumed the screen would always be where it was on an 512K machine.. when brave hackers started soldering RAM chips piggyback on top of the existing chips to expand their memory, the screen location moved, and those games broke.

Then there were the programs that broke for a different reason when people started expanding their machines to the 4 Meg limit. Sloppy programming resulted in memory accesses above the "640K limit" which generated Bus Errors and Bombs. Either the programmers never thought anyone would need to expand beyond 640K.. er.. to 4 Megs, or they didn't themselves have a 4 Meg machine to test their programs on, so they didn't know they'd break on a fully expanded ST.

If the Falcon game programmers assume that the clock speed is, and always will be 16 Mhz, then yes.. there's a good probability that your Falcom030 games will either break on faster models, or will be to fast to be playable.

On the other hand, if the programmers use internal timers for delays instead of delay loops in the programs, then the games will probably run OK on faster Falcons.

PC owners went through this exact same thing when faster machines started to become routinely available. The "stock" PC had been frozen at 4.77 Mhz for a long time... when 8 Mhz or faster PCs started showing up, a lot of the games written for those original machines ran twice as fast, or faster..

Now, PC games are written to run at the same speed no matter what kind of PC you run them on.... hopefully Falcon games will be similar.

Sorry, Steve... you're still not demonstrating the ability to read the writtten word...

You, personally, are definately displaying the kind of inability to comprehen what you read that *could* possibly, although very rarely exercised, earn you the "don't be an idiot" response you seem to read between the lines of what I post.. try reading the lines themselves.

How about this.. go get a cup of coffee, maybe a sandwich, then take a deep breath, and go back and read over this thread..

Someone asked a question about RAM.

Someone else gave some info, but made a comment about how difficult PCs can be to configure them when you add more RAM.

I gave an answer to the original question, and added a comment about my own direct personal experiences with expanding a PC's memory.

Now, somehow you've extrapolated that into slinging abuse and calling people idiots..

That's a very creative outlook, and in some circles might be admirable, but for our purposes here, don't you think it would be better to stick to the actual content of messages, and not what you seem to dream up in the blank spaces between the words..?

Tell you what.. if "90%" of what I write is slinging abuse at people and calling them idiots, then it should be pretty easy for you to quote some of them back, right..? How about it.. let's see some of those messages.. (present company excepted, of course).

superiority of 486's.

I've seen a speed test in Current Notes (Atari Mag) and the results were
the following:

The 1985 Atari ST with an 8Mhz 68000 is comparable roughly
to the performance of a 386SX-20 or 386SX-25. Which means 2 years BEFORE
deep pockets were shelling out $3000+ for 386-16's Atari ST's costing
a fraction were dusting everything in sight for not much dinero.

The Atari TT compared to a 486DX-25 outperformed it by 30-40% in
terms of processing throughput, but totally blew it away in terms
of video performance. (ISA bus yes, but remember this comparison was
in 1990)

Message-ID: <1993Jun6.065321.20748@sactoh0.sac.ca.us>
Source record: 204937

Seeing that Atari has announced that the Falcon is now shipping in quantity, and knowing that may or may not mean anything, I was surprised to actually play around with one here n Sacramento.

Has anyone else seen these machines in their local dealers?

By the way, Computer Time has them in stock (really!) and they are asking $1149 for one.

In a way, I am disappointed that they did not use Mega casings and keyboards. Same old mushy keyboard... And dark keys with a light casing??? That looks odd. Maybe if I were to swap my 1040ST keyboard into the Falcon case...

I really like Atari Works, I'll have to get it for my Mega 4...
I love the new desktop, too.

I wonder if they are working on an 040 Falcon....

257. Uploads: tcsh 6.03, BSD /bin/sh for MiNT

Newsgroup: comp.sys.atari.st
Date: 1993-06-06 07:16:54 UTC
From: mh1@irz409.inf.tu-dresden.de
Message-ID: <1us5l6$khd@irz401.inf.tu-dresden.de>
Source record: 204936

Ports of tcsh 6.03 (a vastly improved version of the Berkeley C-Shell csh)
and the BSD Bourne Shell sh (also known as ash) to MiNT (_not_ TOS!) are
now available from atari.archive.umich.edu:/atari/Mint/Shells:

tcsh6033.zoo:
A port of tcsh 6.03.00 to MiNT (distribution PatchLevel 3).

This archive contains a sharable binary, documentation and source
diffs relative to the original tcsh distribution.

sh03bin.zoo:
sh03src.zoo:
A port of sh (from the bsd-net2 distribution) to MiNT (distribution
PatchLevel 3). This version has several fixes/changes applied that
originally have been done by 386BSD folks.

Both archives contain sharable sh binaries, documentation and a
version of /bin/pwd.
The src archive additionally contains complete source code and
source diffs relative to bsd-net2's sh.

The binaries have been linked with an improved version of PatchLevel 30
of the MiNT Library (all those improvement will show up in some
future version of the MiNT Library): They support automatic path
conversion between the DOS <--> Posix formats for environment
variables (PCONVERT) and an extension to the ARGV standard that
allows for passing of blank arguments to subprocesses (docs included;
this new scheme will be supported by one of the next MiNT Libraries).

Share and enjoy!

This must be a load of rubbish because I used to regularly use a 486-33
at work and a TT at home to compile a fairly large C program (40,000+)
and the 486 ripped through the compilation (Zortech) while the TT just
slowly muched its way through - if I had a choice I'd compile on a
486 rather than a TT. As for graphics, yes maybe the TT graphics are
faster than your average 486 steup BUT the TT graphics are complete crap
in comparison. And yes one could buy a graphics card for the TT but have
YOU got a leg and arm to spare.

KN> on one cd - only problem is just about nobody with an Atari has a cd-
KN> rom drive.

If there were such a CD, I would buy a CD-ROM. But as it is now, what do I want to use CD-ROM for on an Atari? GIF CDs and Photo-CD? Don't think that's worth it.

In article <82807@cup.portal.com> Bob_BobR_Retelle@cup.portal.com writes:
>On the other hand, if the programmers use internal timers for delays instead
>of delay loops in the programs, then the games will probably run OK on faster
>Falcons.

Specifically, the game designer has to tie the game to the vertical
blank, then figure out how many vertical blanks there are per game turn
(frame) on the slowest supported machine, and then make the game sit
between frames and wait until that number of vblanks has elapsed since
the last turn. I.e., on slower machines the game will just sit there
killing time. It's a trivial thing to do, but you have to know that
you should be doing it, and early Atari (and PC) programmers didn't
necessarily know, or were too lazy to bother.

An interesting alternative is to make the game use any extra time it
has to render in more detail, move more critters, etc. This is harder
to manage, and often it's best to have the game play the same on all
machines. (Of course, some PC game programmers now assume a 386/25,
and if your machine isn't that fast, the game just runs slowly.)

>PC owners went through this exact same thing when faster machines started to
>become routinely available. The "stock" PC had been frozen at 4.77 Mhz for
>a long time... when 8 Mhz or faster PCs started showing up, a lot of the
>games written for those original machines ran twice as fast, or faster..

Heh... I still have Robotron, which is a boot disk meant for a 4.77 Mhz
PC. When I load it on my 486/33 and start a game I just get

squawk squawk squawk GAME OVER

Instruction timing -- gotta love 'it. :)

Yes, a normal VGA does these, and the ST-resolutions (I do that on
mine). With an SVGA monitor you can run more (interesting ?) interlace
modes. A normal VGA won't do that.

>I too mourn the passing of the days when asking a question brought you
>not only an answer, but offers of further help, examples, far more than
>you ever asked for...

Those days aren't totally done. I, and many others, are more than
happy to help people out with the Atari (assuming I have at least a
reasonable clue as to the answer of a question). If it looks like a FAQ,
I would probably go email than post here, and no doubt others do the same.

You have to remember that the current user base is smaller than what it
used to be, and thus there are probably less people to work from.
Assuming the Falcon gets popular, and more people learn of the net
(it is amazing how many people have acess to the internet, but don't
even realize it), then things may change for the better...

>I used to hope that by answering a question that the next time a new user
>appeared with that same "stupid question", the person I'd helped would
>step forward and answer in his turn...

That's one purpose (at least for me) of email. Besides, just like in
real life (I dunno if the net is real life or not :-) some people are
more outgoing than others, and thus are more likely to say something...

>Now it seems we're all too sophisticated to care about anyone with
>"stupid questions".. all we can do is accuse the questioner of being
>stupid, and make fun of him...

There's no such thing as a "stupid" question. The only stupidity
arises if someone doesn't know something, and isn't willing to ask (since
there's no better way to learn). Besides, using the net (and BBS's in
general) we're really all "faceless" people (except for those who
might have met in real life) so a lot of flamewars that occur are
made by those whose identities are basically shielded behind the ASCII.

Anyways, folks, there's much more important things in life to
get worked up about than computers (just about everything, actually :-)
so everyone take a deep breath, release, and relax (now didn't that
feel good :-)

Robert Anisko

MiNT isn't THAT big. However, you *could* write a MetaDOS file system
driver for Minix file systems (MetaDOS is smaller than MiNT), but
you would lose (a) I/O redirection and (b) long filenames and case
sensitivity. Note that without MiNT's directory reading calls, no
program will be able to read the long filenames.

>of his priority list if I made another "arrogant" request.

A "consumer product company" that sells products for 10 million dollars
in 3 months surely can't afford to set anybody to the bottom of a
priority list. They should be happy about every single machine
they can possibly sell.

Don't worry. Here in Germany it's the same. A big music dealer would like
to sell Falcons here (who else should sell Falcon's I ask!) but isn't
allowed to do so, too.

>If Brodie worked
>for me as director of communications and sent a dealer a FAX like the
>one he sent me he would have been out on the street immediately.

Well, I don't know the fax and the whole story, but I often have the
impression, that the only persons that really can do their job at
ATARI are the hardware developer(s) (and Eric Smith...). Or do you have
any other idea why ATARI has fallen down so deep in the last
3 years?

A good example for that: Someone of the Tramiels gave a big interview
at the CeBit announcing, that ATARI will only produce consumer products
and consumer computers for the future, no High Tech like a TT, no try to
get the machines into the universities (like here in Germany), no try to
get into the DTP area again (like they have done with Calamus and the TT).

Well, such statements are really what the developers here in Germany
want to here! Is there a better way to get rid of the "ATARI machines
are game machines"?

279. Atari.archive.umich.edu faq of sorts

Newsgroup: comp.sys.atari.st
Date: 1993-06-06 22:26:14 UTC
From: weiner@terminator.rs.itd.umich.edu
Message-ID: <1utqu6$ifl@terminator.rs.itd.umich.edu>
Source record: 204856
Cross-posted to: comp.sys.atari.8bit,umich.archives,comp.sys.atari.st

[I thought I'd post this now, before I leave for vacation. Get your questions
in within the week, cuz after that: look out Eurpoe, here I come....]

The atari.archive.umich.edu "Just the 'faqs' faq" - an Umich Atari Posse Product

Recent changes are marked with a *

This faq has been revamped to provide just the "faqs", less talk
and more rock. Ready?

1. How the hell do I get to atari.archive?

By order of preference:
1. AFS (if you don't know what it is, you don't have it, forget I
mentioned it).

2. Gopher (Other gophers/North America/USA/Michigan/Merit/Software
* Archives or Popular Gopher Servers/Software Archives at Michigan).

3. FTP - Be sure to check for mirrors that are closer to home. For
instance src.doc.ic.ac.uk (/computing/systems/atari/umich) and
wuarchive.wustl.edu (/mirrors/archive.umich.edu/atari).
* wustl ran out of disk space and hasn't been keeping all of
us there. Please avoid it until they fix their problem.

4. Mail - Send mail to atari@atari.archive.umich.edu with a body
of help for the help file. Questions about BART to
brode@atari.archive.umich.edu

2. Uploads?

You bet we want 'em. Via afs, cp into /afs/umich.edu/group/itd/archive
/atari/New. Via ftp, ftp into atari/New (will not work at mirrors).
Via gopher, impossible, see mail. By mail, uuencoded chunks to
weiner@atari.archive.umich.edu.

3. Sacrifices in our honour?

You bet. Small children and farm animals only please.

4. Why the hell do things take so long to get from New to the
archive?

* Come on, things haven't been that bad lately, have they?

5. I'm completely confused by this post, who can clarify it for me?

I'll do my best, weiner@atari.archive.umich.edu. If that don't work,
weiner@terminator.rs.itd.umich.edu. If that don't work,
weiner@stat.umn.edu. If that don't work, weiner@beryl.labmed.umn.edu.
If that don't work, Jeff Weiner 414 Erie St SE #14, Mnpls, MN 55414.

* Although note that I will be on vacation from June 14 to July 5.
Look out Europe, here I come!
Good night,
--

If your using MiNT, you can use xyz or one of the myriad sz/rz combos,
and run that from any window you please. Ive been able to do this using
tip, and then defining my shell as xyz.prg within tip (so that a ~!
would spawn off xyz)

Or, altho Ive never used it, I heard that Flash can do background file
transfers?

Throw open the switches to the sonic oscillator,
and step up the reactor power input three - more - points!

283. Problems with my new ST!

Newsgroup: comp.sys.atari.st
Date: 1993-06-07 00:55:14 UTC
From: lancer@wpi.WPI.EDU
Message-ID: <LANCER.93Jun7005514@wpi.WPI.EDU>
Source record: 204880

Well, my first computer was an Atari 800XL, so I've always wanted an ST. On Saturday I finally bought one, a used 1040ST with both monitors, lots of software, etc... But I'm typing this message in on my PC... Why? Because the ST has some problems...

Biggest problem first: It seems to think that it only has 323072 bytes of memory! That's what NeoDesk 2.0's "About..." window tells me. And some large programs refuse to run, saying there isn't enough memory. What is going on here? None of the memory chips seems to be running hot... (at least no ONE chip... About half of them feel warmer than the others...) Any clues? It _IS_ a 1040ST, by the way, and has 32 chips inside... So don't give me any "you sure it's not a 520ST?" *grin*

Next thing: I got an ICD SCSI adapter with it! The guy says that that is "a little flaky" too. Not having a SCSI drive (yet), I don't know about that... Are there any known problems with ICD Links getting fried by static or anything? And where's the cheapest place to get a SCSI drive?

I hooked up an external modem to it... It connected and ran alright (though the modem program, Flash, was a bit weird) but refused to download. Xmodem kept getting CRC and checksum errors. I tried changing all the parameters on both sides. Does anyone know a way to get zmodem into this program? Or how to get xmodem to work? Or can anyone reccommend a better (hopefully PD/Share) term program? And is Kermit and Emacs available for the ST? I would hope so...

The disk drive is a little flaky too. It refuses to read disks sometimes. Maybe 1% of the time. That's not really a problem, since it works the next time. Still, any suggestions? And how hard would it be to hook an old IBM 720k drive to the external drive connector? I've got a power supply for it already... It could sit next to the SCSI HD...

Here's what I've gotten to run on the thing: NeoDesk 2.0 in a 196k RAM disk (so it's good and fast). Flash, Michtron's Utilities Plus, PC Ditto, various Compute! things. Here's what won't run: Some software Mac emulator program, Cad 3D 2.0. These last two report disk errors every time I put them in the drive. Guess I can kiss them goodbye... What kind of support can I expect from these companies? These are all original programs, with documentation, etc... Who's still in business? Particularly Flash. Is Antic still around? Is there a newer version than 1.6?

As for the ST, it reports TOS .19. That's bad, right? How can I upgrade that? And do I need to upgrade it?

I'm sorry for putting so much into one post, but I really like Atari computers (and I've got a UNIX box and a PC, too!) and I'd really like to get my ST up to steam... No matter what, though, it was a great deal! I won't say how much I paid, but it was less than half what I've seen anyone on the net offer anny ST for, let alone one with lots of software and the color and mono monitors...

Thanks for any help. Please post or email. I have a feeling I'll be active on this group in the future...

.s.

what's wrong with NeoChrome ? ;-) It's the only one I use (plus some
art director once in a while, but rarely).

> Anyway, I remember hearing that there is an undocumented feature in
>NEOchrome (at least by version 1.0 it was still undocumented) in which you
>could get an additional painting feature, which looked like a movie camera in
>the paint selection box. (You get it by selecting the Grabber option. Then go
>the the second "R" in the word "GRABBER" and click on it.) I'd like to know
>how to use it? Does anyone know how, or have some documentation on it?
>

OK, here goes :

1. with the mouse, select the zise of the sprites you wish to animate. The
width must be a multiple of 16 (You can't set it to anything else anyways)

2. The right mouse button serves to scroll the screen around IN THAT WINDOW
ONLY ! So move it around until the first sprite is well placed inside. Then
click on the add button.

3. keep doing that until all sprites are ok. You can delete those you missed,
or swap them around. (By using the box in the upper-right corner of the
tool box for the animation. You can store one sprite there, and copy it back
to the cycle afterward.)

4. the speed selector works like for the color cycling. (right mouse button
on he arrow to have it cycle in this diretion. more clicks to make it
faster.)

5. Don't *EVER* hit ESC when it's cycling. The reason it's hidden is because
it's really buggy. so doing something it doesn't expect would probably
result in a) mutilation of the screen b) crash the computer.

I'm replying here without having used it for a while, so I may miss things,
or be wrong. I'll take a look at it when I can, and mail you (or post
if there are requests) an update.

Patrick.

285. HSC MiNTlibs pl30 uploaded to atari.archive

Newsgroup: comp.sys.atari.st
Date: 1993-06-07 01:06:28 UTC
From: dsb@duke.cs.duke.edu
Message-ID: <739415187@amazon.cs.duke.edu>
Source record: 204861
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Sigh. I finally get pl30 done, and now it looks like pl32 is on the horizon. Being out of the loop really sucks, ya know? ;)

But anyway, now on atari.archive are the MiNTlibs pl30 compiled for HSC. The file mnthlb30.zoo actually contains two versions of the libraries -- one with 8-character external names for v1.40 and below, and one with 22-character external names for v2.00 and above (so that I don't have to re-release the library when v2.01 is released).

As always, in the event of the unthinkable (ie. bugs), you can reach me at this address.

>
>If that happens, there won't be much left of Atari to buy...
>

Not quite right. The value of the shares seldom, if ever reflects the true value of a company. The true value, of course, being the capital the company owns. The share price is much a much less useful guide. It only tells you what people think of the company itself.

A 68030 is a 68030 is a 68030. It doesn't matter if the owner of the chip is in the red or black, its value depends on other things.

287. Re: Interesting speed note (486, 68000)

Newsgroup: comp.sys.atari.st
Date: 1993-06-07 01:44:51 UTC
From: ltduck@access.digex.net
Message-ID: <1uu6ij$82m@access.digex.net>
Source record: 204862

If that CN benchmark was the one that I'm thinking of, then it said that the ST got 3 mips. That's simply not possible, considering that it's 8 mhz and the fastest instructions (which do terribly little of use) take four clock cycles. So if you're sitting there doing internal operations or nothing at all, you can't get above two.

288. Forget Me Clock II For Sale

Newsgroup: comp.sys.atari.st

:EMILY: ??.??.??
Hints from Emily Postnews
==========

(Thanks to John Henders (jhenders@jonh.wimsey.bc.ca) for this bit of _humor_.)

Emily Postnews Visits comp.sys.atari.st

(Due to popular demand, (well at least one persone asked anyways), Emily has taken time out of her busy schedule to answer a few commonly asked questions specific to c.s.a.st.)

Dear Emily.
Some Amiga user is raving on c.s.a.st about how wonderful
his computer is, and how awful mine is. What should I do?
signed My Computer is NOT a Toy.

Dear My Computer, etc,etc.
Many people's egos are so tied to their possessions, they
have to affirm their existance by raving about the superiority
of their machine to anyone who will listen. You should immediately
flame these people into cinders, using every rumour or misconception
you've ever heard about their brand of computer, as this will cause
lots of posts, and develop into a massive flame war, which is one
of the main reasons most people read c.s.a.st. If this didn't happen
every six months, everybody would unsubscibe to this newsgroups from
boredom.
Or, you could put comp.sys.amiga.advocacy in the Followup to:
line, and any article replying to yours would go to the newsgroup
designed for this discussion.
Or, if your newsreader supports it, you could build a KILL FILE,
which eliminates any post that has the word Amiga in it.

Kill files can be created in rn and trn by hitting the 'K' key.
This will make a kill file based on the article you were reading
at the time. Then control K will put that file in the editor for you
to play with. You use the same regexp commands here that are in rn.
For example. /[Ff]oo/h:j would search all headers of unread articles
for both Foo and foo, and junk them. Check the docs for your newsreader
for further details.

Dear Emily.
I like flame wars, and want to start one of my own, so my name
will be as famous as Richard Covert's.
Signed, Too much Time on My Hands.

Dear Too much time.
Sorry it took so long to reply, but Richard's in my kill file
and someone had to forward your post to me, or I'd never have seen it.

Flame wars are fun. They're the main reason people creted Usenet,
and should be encouraged at every opertunity.
Some of the most common tricks for starting flame wars are as
follows.
1: Post a note in another newsgroup telling all the users there that
they own a piece of junk, and if they had a half a brain, they'd have the
same computer you do, as it's obviously the best.
2: Toss a bit of slander against another computer in a totally
unrelated post. This guarantees a follow up, even if your original
post wasn't of any interest.
3: Create a signature file that has a put down of another computer
in it. This will get flame wars going in threads that have completely
unrelated Subject: lines, thus slipping through all but he most exacting
kill files.
I hope you find these tips handy in creating your next flame war.
And just remember, your computer MUST be the best, after all, it's yours.

:DEV: ??.??.??
How do I become a developer for the Atari ST?
==========

Contact Gail Bacani, Atari Rep Person, (408)745-2022

[UNITED STATES ONLY. IF YOU LIVE OUTSIDE THE UNITED STATES, CONTACT
YOUR COUNTRY'S ATARI HEADQUARTERS FOR MORE INFORMATION.]

Gail can explain the program to you, and send an information packet if you
desire.

Atari has gone to a 2-tier developer membership. The 'higher quality'
developer support goes to commercial developers, and costs $250. The
'no-hand-holding, no announcement of company future products, no access
to discounted hardware' goes to noncommercial developers, at an initial cost
of $125, plus $50 renewal fee each year.

Both tiers receive the ST/TT Developer Kit and all developers have to fill
in an application form and a non-disclosure agreement. Contact Gail for
more information.

Atari is now selling the developer's kit (or parts of it) seperately. No
project-in-development or non-disclosure agreement is necessary.

:ERR: ??.??.??
What does TOS ERROR nn mean?
What do the bombs on my screen mean?
==========

The information below was written, in part, by Darryl May, and posted on GEnie in January (of ????) by John Townsend. The original also appeared in the June 1988 issue of _Current Notes_ (122 N. Johnson Rd., Sterling, VA 22170). It has since found its way to me, and is being posted to comp.sys.atari.st as a service to readers.

Alan Pratt wrote to tell me that the basic information may be correct, but that it cannot be dubbed "official" unless it originates, on paper, from Atari. This makes sense, as electronic communications are easily modified, even accidentally.

Roland Waldi provided information regarding the difference between TOS and GEM return codes which appears to be correct. The tables have been modified to reflect his information.

The following is an unofficial list of the errors that can appear while you are operating your ST computer.

Error description return code alert box #
==========
OK (no error).....0
Fundamental error.....-1
Drive not ready.....-2
Unknown command.....-3
CRC error.....-4
Bad request.....-5
Seek error.....-6
Unknown media.....-7

:FREE: ??.??.??
What is Free-Net and how can I get access?
=========================================

A "Remodeled" Atari S.I.G. Opens
```

By now many of you have heard of the Cleveland Freenet, or more specifically the Atari S.I.G. on the Cleveland Freenet. For those who haven't, the Cleveland Freenet is an experimental computer system providing free public community telecomputing. Basically, it's a lot like a public library of the future. Many of these systems are popping up all over the country. Don't be surprised if one pops up in your neighborhood in the future.

Recently the Atari SIG has undergone a significant face-lift. All the regular areas are intact including its news sections, user group newsletter, online magazine sections, general as well as specific computer discussion boards (8 bit, 16/32 bit, Lynx, Portfolio), and our weekly Sunday night multi-chat conference.

The conference starts at 8pm EST sharp and is on channel "+Ataricon". What the staff at the Atari SIG has added, has given the Atari SIG the potential to cover all grounds of Atari and its related products.

The most noticeable addition to the Atari SIG is the Programming and Development Forum. This forum is intended to be used by developers, professional programmers, and Atari hackers (the old definition of "hacker") as a means to share ideas, help each other out, and find out the latest technical information on Atari's products. This board is ran by newly acquired SIG Operator, Peter Haller, a professional programmer who is running developer sections on hardware and software development, programming, MIDI applications development, Graphics Design, plus many other sections that can definitely become a programmer and developer's dream come true!

Last, but definitely not least, the Atari SIG has a restructured Product Info and Support Board and a new Special Applications Board. The Support Board includes a vast library of support lists. These lists range anywhere from phone numbers of Atari dealers and producers, to software reviews for 8 bit, 16/32 bit, Lynx, and Portfolio software. To sum it all up this area covers what's out there, who makes it, and how to get it for all Atari products. The Special Applications Board is just starting out. Currently there is an area for users of MIDI on the ST. MIDI users are encouraged to use this as a means to discuss MIDI related topics. This section is expected to expand in the future.

Accessing the Atari SIG has never been easier. One can access it via Internet by telenet'ing to 129.22.8.75 or "Freenet-in-b.cwru.edu" or by calling (216) 368-3888 300/1200/2400 bps. Once on the system, a user can apply for an account application and logon as a visitor. Once here, simply type "Go Atari" to get to the Atari SIG. A visitor can go anywhere on the Freenet and can read anything. They can't post messages until they get their permanent accounts, however.

For additional information on obtaining access to Freenet write to myself via the e-mail addresses above or by writing the SIG at its US mail address:
The Atari SIG

P.O. Box 21815
Cleveland, OH 44121 USA

Lastly, a freenet application is available in the mail by writing a
request to the above address if you rather not download it from Freenet.

The Atari SIG is ready to serve the thousands of Atarians throughout
the world. We look forward to seeing you all real soon! Remember the
staff of the Atari SIG are volunteering their time for no pay and the
Cleveland Freenet, as well as the Atari S.I.G., is a non-profit organization
existing for the free exchange of information.

:MAGS: 93.05.05
What magazines are available for the Atari ST?
==========

If you've got updates, mini-reviews,
or more information on other magazines, please send them to me via e-mail.

As always, WRITE to a company before sending them money for a subscription.

US mags:

AtariUser, published by Quill Publishing Company

Cover Price: US $1.00 Canada $1.45 UK 1.50 (AtariUser is available for free
[$6.00/50 magazine shipping charge] from participating computer dealers,
bookstores & user groups!)

Subcription Rate: $21.30 US Bulkrate, $41.30 US First Class.
Address: AtariUser, 113 W. College Street, Covina, CA 91723 USA

Current Notes, published by Current Notes Inc.

Cover Price: US $3.95

Subscription Rate: $27.00/year (Atari clubs registered with Current Notes may
subscribe at $23.00/year) US, $35.00/year (Canadian club members at $31/year)
Canadian, Foreign rate $44/year.

Address: Current Notes Inc., 122 N. Johnson Rd., Sterling, VA 22170 USA

Atari Interface:

Write for a free sample copy of the Atari Interface magazine
(Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108)

AIM is soon to be available in Canada, Europe and Mexico, and should be in all local WaldenSoftware stores and many bookstores. If your "local" Atari dealer doesn't have it, he should be able to get it for you...

UK Mags:
(Thanks to Sam Marshall <samm@castle.edinburgh.ac.uk> and Kevin Busby <kevinb@syma.sussex.ac.uk> for some of the info here.)

ST Applications:
---

formerly the ST Club Newsletter, this is now the only non-games mag in the UK (although see ST World below). Approx. 4,500 copies per issue sold. News, reviews, interviews, tech tips, general forum, programmers' forum, PD catalogue. DTP'd on an ST. Retains a 'user-driven' feel. Recommended. The associated ST Club runs a PD distribution service and distributes a couple of commercial programs too (Fontkit Plus, UIS III, Molgraph, CRL Virus Killer, etc.).

12 issue Subscription now:
With Disk 6 Mags Without Disk Mags

UK: #26.50 #18.00
Europe (air) #30.50 #21.00
World (air) #38.50 #31.00

Address: ST Club, 2 Broadway, Nottingham, NG7 1PS, UK.

ST World:
---

formerly the leading UK non-games mag. Became a quarterly 'buyer's guide' in Autumn 90.

ST Format:
---

all-purpose 150-page monthly, mainly aimed at young people. Lively, but of uneven quality. Big leisure section, but other areas covered too. Includes cover disk - mix of games demos and (usually out of date) PD utilities. Probably the biggest-selling UK ST mag. Has had several public rows with Atari UK.

Future Publishing, Somerton, Somerset, TA11 6TB Tel. 0458 74011
Fax 0458 74378

Atari ST User:
---

like ST Format. Generally (amongst online users) thought to be not quite as good.

ST Action:
---

games, games and more games. And games.

Atari ST Review:

Lots of info, more mature editorial style than Format, but not so
polished. 1 cover disk per issue.

Subscriptions: PO Box 500, Leicester, LE99 0AA. Tel: 0858 410510.

There are also, I think, some MIDI mags with strong ST content. I don't
have their names.

German Mags:

Atari PD Journal:

('Suspened' from publishing...)

Reviewed in the May '91 issue of Current Notes [from which I'm cribbing this
information, DP-Z]. Hardware and Software reviews, some commercial software
reviewed. Typical issue runs around 90 pages. Special "Katalog" section.

Subscription: DM 70 (normal mail), DM 100 (air mail). Prices may be for
domestic distribution -- write first!

Address: Heim Verlag, PD Abonnement, Heidleberger Landstrasse 194, 6100
Darmstadt 13 GERMANY

ST-Magazin (formerly 68000er):

(monthly) Typical issue: around 150 pages. Includes DTP-magazine CICERO.

Subscription: DM 77 (domestic distribution); foreign - write for information

Address: ST-Magazin, Bretonischer Ring 13, 8011 Grasbrunn, West Germany,
Phone: ++49 89 456 160

ST Computer:
---

11 issues/year, typical around 180 pages

Subscription: DM 80 (domestic), DM 100 (normal mail), DM 130 (air mail)

Address: Heim Verlag, Heidelberger Landstr. 194, D-6100 Darmstadt 13 GERMANY

French Mags:

ST Magazine

Monthly in French. Oriented towards developers, professional users. Comes
with a disk each month.
ST Magazine - 10, rue Hegesippe Moreau - 75018 Paris - France

(French Teletel users: 3615 Teletel access, code STMAG)

STart Micro

Monthly, includes a cover disk. 11 issues per year. 64 + 16 (separated) pages.
Price: FF38 per issue, subscription: FF360. Subjects: Desktop publishing,
graphics, initiations to C and GFA Basic, survey of outcoming software, music,
folders. Minitel access: 3615 code ATARI. Address: FC Press, 57 rue Danton,
92300 Levallois-Perret, France.

Dutch Mags

ST, published by Stichting ST , postbus 11129 2301 EC Leiden the Netherlands
---
cover price: fl 6,95
Independent magazine by and for atari ST users.
covers all different topics from applications to games and hardware.
60 pages.

6 times a year. One year subscription fl 35,-
black and white pages.

Atacom, by Atari Club Groningen.

Never seen this one. I suppose you have to be a member of the club or so.
price is fl 4,95.
Adress of the club: Atari Club Groningen, Postbus 9164
9703 LD Groningen, the Netherlands.

Atari Nieuws, by Atari ST computer club Nederland

News paper sized publication. Lots of colour on newspaper pages. Not too many
pages though.
price is fl 3,95 (cheap cheap)
monthly publication.
adress: ACN, Postbus 5011, 2000 CA Haarlem, the Netherlands.

GFA-info, by GFA gg (usergroup)

Publication of the GFA-basic usergroup. This group has a lot of mainly
educational software available.
price is fl 5,00

adress: GFA gg, Frankrijklaan 14, 2034 BA Haarlem, the Netherlands

ST News, by Stichting Computers Eindhoven

This is an electronic magazine. It has been around for about 6 years now
and is completely in English!!! The first issues were in Wordplus format
back in 1986 but from the 6th issue on it included a readerprogram
both for color and monochrome. Even with music.
price is fl 10,00

adress: S.C.E., Kornoeljelaan 22, 5552 RC Valkenswaard

Swiss mags:

Atari ST News Schweiz

Dutch Atari ST Nieuws translated into German for the Swiss :-)

:TIPS: 93.03.01
TIPS AND HINTS from other users
==========

Any 'multisync' monitor which handles 70 video fields a second can be used with the ST; the custom cable involves no tricks, or commercial ones are available. The original NEC multisync does NOT handle 70 fields a sec.

More than 3 bombs often means more than 1 error, so interpretations are tricky.

An ST-formatted disk which is not readable by a PC can be made readable by putting the 3 bytes EB 34 90 (those were 3 bytes of hex) at the beginning of the boot sector (sector 1 of track 0, I believe). This can be done with either an ST or PC absolute sector editor. The Desktop of TOS 1.4 and higher does this automatically.

Some (older) PC-3.5"-drives cannot deal with the short track-header produced by ST formatters. On those drives, ST-formatted disks are not readable, independent of their boot sector contents. The other way, however, does always work: format on the PC.

When using disks formatted on a PC in an ST, make sure to insert and access a disk with a different serial number in between disk changes.

For those with the 'inaccessible' mouse and joystick ports, a joystick extender cable will make life easier. The Y-cable joystick extenders make it extremely easy to keep mouse and joystick connected to port 0, and a joystick extender cable in port 1 makes for easy hookup after you've moved the machine.

BARREL is a program which can redirect printer-data to a file. It comes in handy when your printer is unavailable, and the program does not already have an option to 'print-to-a-file'. (It is available on the atari.archive server.)

DBLEFEAT is a program which can redirect disk access from, say, drive A to drive B. Handy when a program 'hard-codes' the data drive, and you wish to use your hard drive instead. (It is available on the atari.archive server.)

On the Desktop, holding the right mouse button allows
you to manipulate files in other windows. This is useful for a number of reasons. An example is this: say D:\BLAH.ARC is a file you would like to extract to D:\, but ARC.TTP is on C:\. Top D:\'s window, then hold the right button while double-clicking ARC.TTP in an inactive window.

:ZNET: ??.??.??
Where can I get copies of ZNET?
==============================

ZNET is now Atari Explorer Online. Please see EXPLOR for more info.

:EXPLOR: ??.??.??
Where can I get copies of Atari Explorer Online?
==
Atari Explorer Online magazine is available on CompuServe and GEnie. You can
also get copies mailed to you by sending an e-mail message to

stzmagazine-request@virginia.edu

indicating you wish to subscribe.

They won't get to you on Friday (which is when they're posted), but Greg
Lindahl provides an excellent service to the networking community by sending
these out.

Atari Explorer Online and some information from the Current Notes user
magazine are also available from the atari.archive server under
/atari/magazines.

:PD: ??.??.??
Where can I get Public Domain/Shareware software?
===

There are FTP sources and a comp.sources.atari.st/comp.binaries.atari.st
mail server. You can also try the commercial on-line services such as
GEnie, CompuServe, Delphi and Bix.

Using FTP, most files should be retrieved in BINARY format (at least those
ending with the suffix of .ARC, .LZH, .ZOO, .PRG, .TTP, .TOS)

Mail servers encode files. You will need a program called 'uudecode' in
order to change files ending with the suffix .UUE (or .UAB, .UAC, etc.)
into their original form.

:MAIL: ??.??.??
E-Mail file servers

archive-server@spud.hyperion.com:

Spud holds all of the comp.sources.atari.st / comp.binaries.atari.st
postings. If you aren't reading these two newsgroups, you should consider
doing so. You may obtain uuencoded files as e-mail. You can obtain a
help file by mailing a message to archive-server@spud.hyperion.com, with
the main body of the message being the word 'help'.

atari@atari.archive.umich.edu:

The atari.archive server is mentioned many times in this article. It contains
a multitude of Atari ST PD and shareware programs. If you don't have access

via FTP you can obtain many of the files via e-mail. You should first obtain a help file by mailing a message to atari@atari.archive.umich.edu, with the main body of the message being the word 'help.'. If you are from a uucp site, please enclose this statement also 'path host1!host2!....', where host1!host2!... is your path. Please read the help file completely before you ask questions, and then send any you may have to jon@atari.archive.umich.edu. Any questions about the archive or specific files go to weiner@atari.archive.umich.edu (or weiner@terminator.rs.itd.umich.edu, jeff.weiner@um.cc.umich.edu, weiner@zircon.labmed.umn.edu, or weiner@umnstat.stat.umn.edu :-)

archive-server@micros.hensa.uk.ac:

This is a UK public domain archive, available to sites within the UK via via JANET.

info-server@Germany.EU.net:

This is a german public domain archive. This only has comp.binaries.atari.st and comp.sources.atari.st.

archive-server@Germany.EU.net:

Same place as above, but this one carries other software than just comp.binaries.atari.st and comp.sources.atari.st.

mail-server@cs.ruu.nl (or uunet!mcsun!hp4nl!ruuinf!mail-server):
---
send the following message

```
begin
path john@highbrow.edu (PLEASE SUBSTITUTE *YOUR* ADDRESS)
send ATARI-ST/index
end
```

NOTE: *** PLEASE USE VALID INTERNET ADDRESSES IF POSSIBLE. DO NOT USE ADDRESSES WITH ! and @ MIXED !!!! BITNETTERS USE USER@HOST.BITNET ***

The path command can be deleted if we receive a valid from address in your message. If this is the first time you use our mail server, we suggest you first issue the request:
send HELP

LISTSERV@UOGUELPH.BITNET:

Mail messages with the contents HELP will bring you some usage information and GET PROG-A16 FILELIST will provide you with a list of files. Subscriptions to INFO-A16 are also available on this server. INFO-A16 is a digest of messages from comp.sys.atari.st.

:FTP: 93.05.05
Anonymous FTP servers

Note: The generally accepted practice for FTP use is as follows:

1. Limit access times to non-working hours. This is usually 6-8 pm
to 8-9 am LOCAL time. LOCAL time means local to the computer
you are accessing! For example, 4 P.M. in Minneapolis, Minnesota
is 10 P.M. in England, and 10 A.M. in Germany is 4 A.M. in New
York.

2. Once you connect, issue the following commands at your FTP
prompt:

user anonymous
<YOUR e-mail address should be entered at the Password: prompt)
ls
cd <to the appropriate directory>

3. Limit downloads, especially across the ocean. Remember, there are
other people who are using the same lines as you.

Atari FTP sites (the list is -not- exhaustive)
---

atari.archive.umich.edu [141.211.164.8]

uk.ac.lancs.pdsoft (available to UK users via JANET)

Note: Access is a bit different for this archive site, use the following:

user pdsoft
pdsoft (at the Password prompt)

ftp.Germany.EU.net [192.76.144.75]

ftp.cs.ruu.nl [131.211.80.17]

src.doc.ic.ac.uk

This site has a mirror of atari.archive.umich.edu in /computing/systems/
atari/umich.

:COMP: 93.03.01
Atari-related companies
==========

This is a (still under construction) list of companies and addresses that
might be of use to Atari ST users. Please send me addresses for the blank ones
on this list. See also IAAD, it lists many more companies that are not on
this list.

Welcome to comp.sys.atari.st! Please read this FAQ before posting a question
to comp.sys.atari.st, since a lot of common questions are answered here.

Thanks to David Paschall-Zimbel (davidli@simvax.labmed.umn.edu) for
compiling most of this FAQ.

Entries are dated by the last change. ??.??.?? means they were last changed
before the dates were added.

The following is an index of the questions answered in this part of the FAQ.
For easy access to a particular question, search for the tag surrounded by
colons (i. e. :GNU:). Questions marked with '*' are new or changed.

Welcome to comp.sys.atari.st
============================

This newsgroup is devoted to discussion about 16 and 32 bit Atari micros. At
present that includes the Atari 520ST, 1040ST, Mega ST, STe, STacy, Mega STe,
and the Atari TT. There are also emulators for the Apple Macintosh and IBM
PC/XT/AT available.

Most of the people who read this newsgroup are technically oriented.
The newsgroup serves as a resource for Atari users ... feel free to
contribute to the discussions.
```

Associated newsgroups include:

comp.binaries.atari.st ! uuencoded binary programs
comp.sys.atari.st.tech ! technical programming/hardware topics
comp.sources.atari.st ! uuencoded/shar sources

:ARCS: 93.01.30
How do I deal with Archived files (.ZOO, .ARC, .LZH)?
==========

Files ending with suffixes .ZOO, .ARC, .ZIP and .LZH are archive files. They are binary files which may contain one or more other files in a compressed format. Archive files usually take up less disk space, and for this reason have become quite popular for transferring large files via modem.

In order to extract the files from an archive file, one must use an archive program. Here are the correspondences:

ZIP Use UNZIP.TTP or STZIP.PRG
ARC Use ARC.TTP
LZH Use LHARC.TTP
ZOO Use ZOO.TTP

A few hints for first-time users:

* Most archivers will give a short summary of commands if invoked with no arguments.
* If in doubt, to extract a file, copy the archiver to the directory that the file is in, and run the archiver with the arguments 'x [filename]'.
* If you have TOS 1.4 or higher, and/or a CLI, you can avoid copying the archiver by just changing the current directory to where the file is. See TIPS for a tip on how to do this from the desktop on TOS 1.4 or higher.
* Read the documentation for the archivers you use, they will almost certainly answer all your questions. Documentation is usually included in both the source and binary distributions (such as zoo21bin.zoo).

ARCHIVERS
These programs are all available via FTP from the atari.archive server, in the /atari/archivers directory. Recommended files are:

arc602.ttp - version 6.02 of ARC, includes features to archive subdirectories and also include comments with files.

arc602.arc - contains documentation. UnArc using arc602.ttp.

arc521e.arc - older version of ARC. Used mostly by those who want speed, better compression, and don't care about archiving subdirectories. UnArc using arc602.ttp.

lharc.ttp - version 2.0 of LHARC.

lzh201i.lzh - Thomas Questors lzh utility. German documentation. UnArc using lharc.ttp

stzip21.lzh - STZip, with GUI interface

unzip41.lzh - Old version of unzip

zoo21.ttp - version 2.1 of ZOO

zoo21bin.zoo - ZOO archive includes documentation. UnArc using
zoo21.ttp.

:MSA: ??.??.??
Some info on Magic Shadow Archiver
==================================
(This was provided by Chris Herborth)

MSA Archives

The Magic Shadow Archiver (MSA) is a disk archiving program that allows an entire disk to be compressed into one file for transmission. The Magic Shadow Archiver (in shadow.[arc?|lzh?|zoo?] on atari.archive.umich.edu in ~/Archivers) creates .MSA files, which are often compressed using a normal archiver, such as zoo or lharc.

Magic Shadow is notoriously bad when used on a 1/2 meg ST and only one floppy drive. Its disk access and memory use are very badly thought out, and could result in over 160 disk swaps when unpacking an 80 track, double-sided disk.

Due to the fact that it was the _only_ disk image archiver around for quite a long time, Magic Shadow is the de-facto standard for creating disk images of computer demos and other pieces of software that cannot be easily compressed as files.

Because MSA files are disk images, they can only be used to recreate a floppy disk. There is (currently, see below) no way to extract the files from an MSA archive without writing it to a floppy disk.

Magic Shadow works perfectly with any legal TOS floppy format, even high density disks found in modified STs and most MegaSTes and TTs.

Chris Herborth (herborth@pinot.waterloo.ncr.com at work,
cherborth@semprini.tdkcs.waterloo.on.ca at home,
C.HERBORTH on GEnie) is writing a much more efficient MSA extractor, called UnMSA. UnMSA will minimize the number of disk swaps, and speed decompression considerably.

Daryl Richards (no email address, yet) is working on an MSA-Mounter, which will allow someone to unpack an MSA archive to RAM or a file on a hard disk. This uncompressed disk image will then be added to the system as a logical drive (much the same way a RAMdisk adds a drive to the system). MountImage on the Mac is an example of the way MSA-Mounter will eventually work (MountImage is so good, you can install new versions of the Mac OS using floppy disk images stored on your hard drive).

:CLI: ??.??.??
What Command Line Interpreters are available?
===

There are a large number of Command Line Interpreters for the Atari ST.
Some of the more popular ones include:

gulam the 'classic' cli, somewhat UNIX in flavor

BASH GNU Bourne Again Shell

ksh Korn Shell - available under MINT

gemini MUPFEL is the shell used by the gemini environment

master MS-DOS/Unix mixture, shareware.

okami a German shell with many useful utilities built in

pcommand an MS-DOS-like shell

csh C-shell, standard on Unix

tcsh Enchanced C-shell - available under MiNT

Check atari.archive under /atari/cli or /atari/mint, or check one of the
other FTP sites for files.

:ERR: ??.??.??
What does TOS ERROR nn mean?
What do the bombs on my screen mean?
==========

The information below was written, in part, by Darryl May, and posted on
GEnie in January (of ????) by John Townsend. The original also appeared in
the June 1988 issue of _Current Notes_ (122 N. Johnson Rd., Sterling, VA
22170). It has since found its way to me, and is being posted to
comp.sys.atari.st as a service to readers.

Alan Pratt wrote to tell me that the basic information may be correct, but
that it cannot be dubbed "official" unless it originates, on paper, from
Atari. This makes sense, as electronic communications are easily
modified, even accidentally.

Roland Waldi provided information regarding the difference between TOS and
GEM return codes which appears to be correct. The tables have been modified
to reflect his information.

The following is an unofficial list of the errors that can appear
while you are operating your ST computer.

Error description return code alert box #
==========
OK (no error).....0
Fundamental error.....-1
Drive not ready.....-2
Unknown command.....-3
CRC error.....-4
Bad request.....-5
Seek error.....-6

```
Unknown media...................-7
Sector not found................-8
No paper........................-9
Write fault.....................-10
Read fault......................-11
General error...................-12
Write protect...................-13
Media change....................-14
Unknown device..................-15
Bad sectors on format...........-16
Insert other disk...............-17
Invalid function number.........-32.............1
File not found..................-33.............2
Path not found..................-34.............3
No handles left.................-35.............4
Access denied...................-36.............5
Invalid handle..................-37.............6
Insufficient memory.............-39.............8
Invalid memory block address...-40.............9
Invalid drive specified.........-46............15

No more files...................-49............18
Range error.....................-64............33
Internal error..................-65............34
Invalid program load format....-66............35

The last code is the infamous "TOS error 35"!

Also, some unofficial information via Alan Pratt:

Notably, you should add -48: ENSAME (not the same drive, occurs when
you call Frename and the two names you give aren't on the same drive),
and -67: EGSBF: you can't use Mshrink to GROW a block of memory.

Those bombs that appear on your screen are error messages from
the 68000 micro-processor.

Number
Description of bombs

```

```
:GDOS: 93.05.05
What is GDOS, and where can I get it?
====================================
```

GDOS stands for Graphic Device Output System (at least that's what my copy of STart, volume 1 number 1 said...)

There is a newer version, called SpeedoGDOS, which should be available commercially from Atari. It is currently included with AtariWorks, and some Falcon packages. SpeedoGDOS uses scaleable fonts - you do not need to create a font file for every point size. There are desk accessories which allow you to manipulate available fonts, and also CPX programs for the newer Atari Control Panel. For those who only have limited memory, a newer version of GDOS is also included with the distribution. For those with investments in older bit-mapped GDOS fonts, they may be used with the new version of GDOS or used as bit-mapped (ie. non-scaleable) fonts within SpeedoGDOS.

You can get a copy of "Everything You Ever Wanted to Know About GDOS (and more)" by Douglas N. Wheeler from the atari.archive server. The file is /atari/programming/gdos.arc.

There is a German version of GDOS available from the atari.archive server. The file is /atari/utilities/amcgdos.arc.

Currently, there are no truly public domain sources for the GDOS system files or font files (at least those supplied by Atari). You can get these files with many commercial programs, such as Degas Elite, WordFlair, etc. You might also want to check your local user group to see if they received a copy of the WordFlair demo program (also available on GEnie). The demo program appears to have the GDOS system and font files.

In the UK The ST Club (2 Broadway, Nottingham, UK NG1 1PS. Tel 0602 410241, Fax 0602 241515) is a licensed GDOS distrubutor:
Catalogue No's:
GDOS-A Driver + Fonts 9-pin
GDOS-B Driver + Fonts 24-pin

GDOS-C Installed system for Opus (9 pin)
GDOS-D Opus 24-pin
GDOS-E FontGDOS + drivers
GDOS-F 300dpi printer fonts

Disks 2.95 pounds each.

:GNU: 93.01.30
What GNU software is available for the ST?
==========

The Free Software Foundation C compiler, commonly known as GNU C (or gcc) is avaiable for the Atari ST. The minimal memory required to do any useful (i.e. beyond 'hello world') programming is 2 megabytes. A 4 megabyte system is recommended.

There is an extensive archive of the latest GNU C programs via anonymous FTP on atari.archive. GNU C is also available at most European FTP sites. The latest version of GCC available for the ST is 2.3.2, this version includes built-in support for C++.

Note that most GNU documentation comes in TeXinfo format. Documentation in this format can be fed into TeX for printing. It can also be processed by Emacs' texinfo to make an info file, which can be viewed on-screen with Emacs' info mode. These two functions can also be performed by the standalone programs 'texinfo' and 'info' (on atari.archive as /atari/tex/tnxf241b.zoo).

The following can be found in the /atari/gnustuff/tos directory of atari.archive: (Note: all of these have Unixmode and MiNT support)

BASH Bourne-again shell
BISON Yet another YACC (Yet Another Compiler Compiler)
COMPRESS Compatible with Unix compress
DIFF Compares files; PATCH does the inverse
EMACS Extreme editor :-)
Fileutils Unix file utilities
FLEX Lexical analyzer, like Unix lex
GAWK AWK report generation language
GCC 2.1 C, C++ compiler
GDB GNU debugger, with source level C support
Ghostscript Postscript clone
GROFF Text formatting system
GREP Regular expression search, like Unix grep
MAKE Like Unix make
MAKEINFO Stand-alone system to process .info files
PATCH Changes files from diffs; DIFF does the inverse
PROF Profiles executable code
RCS Revision Control System
SED Stream editor
Smalltalk Smalltalk; object oriented language
TAR Tape archiver like Unix tar

:HAM: ??.??.??
Where can I find Ham Radio software for the ST?
==========

Plenty of Ham Radio software is available for the Atari ST:

Morse code
Radio Teletype (RTTY)
Packet Radio (W0RLI BBS and K9AQ TCP/IP)
Satellite Tracking
WEFAX
Color Slow Scan TV (SSTV)
etc.

For more information contact the Atari Microcomputer Network:

Newsletter Editor - Gil Frederick, VE4AG

Winnipeg, Manitoba
R3K 1M2 Canada
or
Program Librarian - John Adams, KC5FW
17106 Happy Hollow
San Antonio, TX 78232
U.S.A.
or
Tune into the weekly net Sundays 16:00 UTC on 14.325 MHz.

73,
John Langner, WB2OSZ

:LANG: ??.??.??
Public Domain/Shareware languages...
==========

There are a large number of programming languages available for use with the
Atari ST. Programmers seem to flock to the Atari ST, and if you know of a
language, you can probably find it, or an equivalent, for the ST.

68000 assembler/disassembler
abc
APL
AWK
BASIC
C
C++
cross assemblers (z80, 6502, 68xx,8031/80xx)
Elan
FORTRAN
FORTH
FP
Hope
ICON
LISP

Little Smalltalk
Modula2
OPS5
perl
PROLOG
SCHEME
SIOD
Smalltalk
XLisp
XProlog
XScheme

Check the atari.archive server under /atari/languages. Most other archive sites will have a language directory which you can also check.

:MINIX: ??.??.??
Is MINIX available on the Atari ST?
==========

MINIX is a UNIX-like operating system for the IBM PC, XT, AT, 386, and PS/2, as well as the Apple Macintosh, Commodore Amiga, Atari ST, and later in 1991, Sun SPARC. It is available with all the source code for the entire operating system, the libraries, and nearly 200 UNIX-like utilities.

Demonstration disks for the IBM PC line and Atari ST are available for free via anonymous FTP for people on the Internet. A Macintosh version will be online soon. (If you can't wait, see below.)

To get a free demo disk and the manual, use ftp to connect to ftp.cs.vu.nl (192.31.231.42) and look in pub/minix/demo. The READ_ME file describes the contents of the directory and how to use it. Be sure to fetch and read this first. It contains important information.

If you don't have FTP access, you can buy the demo disk package from Prentice-Hall for $10 by calling (201) 767-5969 or FAX (201) 767-5625. Please DON'T ask me to send it by email. I have quite enough work already thank you. The ordering numbers for Prentice-Hall are:

- MINIX 1.5 IBM demo disk (0-13-582768-x) (in stock now)
- MINIX 1.5 Atari demo disk (0-13-582792-2) (in stock now)
- MINIX 1.5 Macintosh demo disk (0-13-582784-1) (in stock now)

Please note that although the demo disks are available for free on line, MINIX itself is copyrighted software and is not available on line. The demo disks are also copyrighted, but permission is hereby granted to upload and use them for evaluation purposes. The READ_ME file tells how MINIX can be ordered.

AS A COURTESY TO US, PLEASE DO NOT FTP DURING BUSINESS HOURS (EUROPEAN TIME). PLEASE FTP AFTER 11 A.M. EASTERN STANDARD TIME.
If you want to follow the MINIX discussion, read the comp.os.minix newsgroup, which is quite active and has almost 50,000 subscribers.

Have fun!

Andy Tanenbaum (ast@cs.vu.nl)

:MINT: ??.??.??
What is MiNT?
=============
MiNT is a free multitasking operating system extension for TOS. It is somewhat
like BSD Unix from the programmer's perspective. MiNT can run up to 1 GEM
program along with a lot of character-based programs simultaneously. MGR
and MW2 can both put multiple terminal windows on screen, and bgacc can
put a number of terminal windows on a GEM screen. MiNT and lots of stuff to go
with it can be found at atari.archive.umich.edu:/atari/mint.

TOSWIN is the new replacement for bgacc: it provides lots of nice features like
variable fonts, menus, selectable window gadgets, etc. GEMTERM is a similar
package (it's not part of the standard MiNT distribution) modelled after TOSWIN
and XTerm.

A somewhat interesting note: MiNT is now the kernel of Atari's multitasking
OS, MultiTOS. Originially MiNT stood for 'MiNT is Not TOS', but it's now
'MiNT is Now TOS'. :-)

:XWIN: 93.03.01
Is there a version of XWindows for the ST?
==

There actually is a port of XWindows to the ST now, although it is pricey.
Here's the (slightly hacked up) announcement for it:

X/TOS/window/server and X/TOS/window/server/color

Vendor:
X/software Michael Gehret
X/TOS division
Marktstrasse 8
W-8944 Groenenbach
Germany
TEL: +49 8334 1411
FAX: +49 8334 6245
email: xtosinfo@xsoft.uucp
CPU:
Atari Mega ST, STE, TT
68000 to 68040
Memory:
2 Mbytes (4 Mbytes recommended)
Operating System:
TOS 1.4 or higher
Mouse:
Atari mouse
Graphics:
X/TOS/window/server:
monochrome 640x400x1,

monochrome 1280x960x1 (TT, SM194)
X/TOS/window/server/color:
monochrome 640x400x1,
monochrome 1280x960x1 (TT, SM194)
color 320x200x4
color 640x200x2
color 640x480x4
color 320x480x8
Ethernet Card:
Atari Card (Mega or VME bus)
Riebl/Wacker (Mega or VME bus)
Biodata BioNet 100 II (DMA port or VME bus)
Network Software:
Atari/Riebl/Wacker ANS TCP/IP
Biodata TCP/IP
Disk Space:
none (two floppy disks, may load fonts from second disk or font server)
Features:
full X11 Release 5 implementation
Shape, Multi-Buffering, MIT-SUNDRY-NONSTANDARD extensions
PEX extension optional
support of font server protocol
support of X Display Manager Protocol
access control support
compatible to OSF/Motif and OpenLook
high performance (more than 32,000 Xstones on TT)
fast cursor tracking
backing store and save unders support
size of virtual screen limited by memory only, automatic panning
X/TOS/window/server/color supports all video modes at the same time,
including dynamic visuals
loadable key maps (xmodmap format), full support for European keyboard
layouts
3-button mouse emulation with Atari 2-button mouse
may run parallel to GEM (switching with hot key), configurable multi
tasking priorities
about 50 fonts supplied

:DEMOS: ??.??.??
Why won't demo x run on my machine?
==========

90% of the time, if a demo does not run on your American ST, you probably
need to be in 50Hz mode to use it. Get a program like 50hzboot.prg from
atari.archive to allow this.

:PAINT: ??.??.??
What is the format for [x] paint program data?
==========

There is a periodic posting of ST Picture Formats, edited by David Baggett.
The file is on the atari.archive server under /atari/graphics/picfmts.doc.

:PD: ??.??.??
Where can I get Public Domain/Shareware software?
==========

There are FTP sources and a comp.sources.atari.st/comp.binaries.atari.st
mail server. You can also try the commercial on-line services such as
GEnie, CompuServe, Delphi and Bix.

Using FTP, most files should be retrieved in BINARY format (at least those
ending with the suffix of .ARC, .LZH, .ZOO, .PRG, .TTP, .TOS)

Mail servers encode files. You will need a program called 'uudecode' in
order to change files ending with the suffix .UUE (or .UAB, .UAC, etc.)
into their original form.

:MAIL: ??.??.??
E-Mail file servers

archive-server@spud.hyperion.com:

Spud holds all of the comp.sources.atari.st / comp.binaries.atari.st
postings. If you aren't reading these two newsgroups, you should consider
doing so. You may obtain uuencoded files as e-mail. You can obtain a
help file by mailing a message to archive-server@spud.hyperion.com, with
the main body of the message being the word 'help'.

atari@atari.archive.umich.edu:

The atari.archive server is mentioned many times in this article. It contains
a multitude of Atari ST PD and shareware programs. If you don't have access
via FTP you can obtain many of the files via e-mail. You should first obtain a
help file by mailing a message to atari@atari.archive.umich.edu, with the main
body of the message being the word 'help.'. If you are from a uucp site,
please enclose this statement also 'path host1!host2!....', where
host1!host2!... is your path. Please read the help file completely before you
ask questions, and then send any you may have to jon@atari.archive.umich.edu.
Any questions about the archive or specific files go to
weiner@atari.archive.umich.edu (or weiner@terminator.rs.itd.umich.edu,
jeff.weiner@um.cc.umich.edu, weiner@zircon.labmed.umn.edu, or
weiner@umnstat.stat.umn.edu :-)

archive-server@micros.hensa.uk.ac:

This is a UK public domain archive, available to sites within the UK via
via JANET.

info-server@Germany.EU.net:

This is a german public domain archive. This only has comp.binaries.atari.st
and comp.sources.atari.st.

archive-server@Germany.EU.net:

Same place as above, but this one carries other software than just
comp.binaries.atari.st and comp.sources.atari.st.

mail-server@cs.ruu.nl (or uunet!mcsun!hp4nl!ruuinf!mail-server):
---
send the following message

begin
path john@highbrow.edu (PLEASE SUBSTITUTE *YOUR* ADDRESS)
send ATARI-ST/index
end

NOTE: *** PLEASE USE VALID INTERNET ADDRESSES IF POSSIBLE. DO NOT USE
ADDRESSES WITH ! and @ MIXED !!!! BITNETTERS USE USER@HOST.BITNET ***

The path command can be deleted if we receive a valid from address in your
message. If this is the first time you use our mail server, we suggest you
first issue the request:
send HELP

LISTSERV@UOGUELPH.BITNET:

Mail messages with the contents HELP will bring you some usage information
and GET PROG-A16 FILELIST will provide you with a list of files. Subscriptions
to INFO-A16 are also available on this server. INFO-A16 is a digest of
messages from comp.sys.atari.st.

:FTP: 93.05.05
Anonymous FTP servers

Note: The generally accepted practice for FTP use is as follows:

1. Limit access times to non-working hours. This is usually 6-8 pm
to 8-9 am LOCAL time. LOCAL time means local to the computer
you are accessing! For example, 4 P.M. in Minneapolis, Minnesota
is 10 P.M. in England, and 10 A.M. in Germany is 4 A.M. in New
York.

2. Once you connect, issue the following commands at your FTP
prompt:

user anonymous
<YOUR e-mail address should be entered at the Password: prompt)
ls
cd <to the appropriate directory>

3. Limit downloads, especially across the ocean. Remember, there are
other people who are using the same lines as you.

Atari FTP sites (the list is -not- exhaustive)
---

atari.archive.umich.edu [141.211.164.8]

uk.ac.lancs.pdsoft (available to UK users via JANET)

Note: Access is a bit different for this archive site, use the following:

user pdsoft
pdsoft (at the Password prompt)

ftp.Germany.EU.net [192.76.144.75]

ftp.cs.ruu.nl [131.211.80.17]

src.doc.ic.ac.uk

This site has a mirror of atari.archive.umich.edu in /computing/systems/
atari/umich.

:TEX: ??.??.??
Is TeX/LaTeX available on the Atari ST?
==========

The TeX/LaTeX typesetting programs are available on the Atari ST. Check the
atari.archive server under /atari/tex. Fonts and device drivers
(including one for the Epson 9-pin printers) are available on the
atari.archive server.

The latest version of TeX (3.14) has recently been made available on the
atari.archive server. The files are in a subdirectory of their own.

Graham Higgins recently wrote a message in comp.sys.atari.st indicating the
minimum files needed to get a working TeX/LaTeX system up and running on the
Atari ST. He said:

You'll need, at minimum:

The binaries for LaTeX/TeX :StTeXBin
The style files :StTeXSty
The font macros :StTeXTfm

If you want to screen-preview, you'll need screen font files (showdvi)
If you want to print locally, you'll need printer font files (dvifont)

Allow 5Mb.

For a step-by-step article on setting up Tex and LaTeX, send an e-mail request
to davidli@simvax.labmed.umn.edu. Be sure to mention 'tex.setup'.

There is also a complete, ready-to-install distribution called CS-TeX. The
latest version, 4.0, is available at atari.archive: /atari/tex/cs-tex-4.0.
This consists of 8 disks full of TeX stuff, plus an installation program
that takes care of the details for you.

```

Welcome to comp.sys.atari.st
============================

This newsgroup is devoted to discussion about 16 and 32 bit Atari micros. At
present that includes the Atari 520ST, 1040ST, Mega ST, STe, STacy, Mega STe,
and the Atari TT. There are also emulators for the Apple Macintosh and IBM
PC/XT/AT available.

Most of the people who read this newsgroup are technically oriented.
The newsgroup serves as a resource for Atari users ... feel free to
contribute to the discussions.

Associated newsgroups include:

comp.binaries.atari.st ! uuencoded binary programs
comp.sys.atari.st.tech ! technical programming/hardware topics
```

comp.sources.atari.st ! uuencoded/shar sources

:MODELS: 93.01.30
All the models in the ST line
==========

This is a pretty complete list of all the ST/TT models and their main features. If you have any additions/correction, of course, send them to me.

Feature key:
CPU's:
8 8 MHz 68000
16 16 MHz 68000
16/3 16 MHz 68030
32/3 32 MHz 68030

RAM:
/1 128kB
/5 512kB
1 1MB
2 2MB
4 4MB
S SIMM slots for expansion

Built-in:
F Floppy
M TV modulator

Extra:
AV 8 bit digital stereo audio, 4096 colors, hardware scrolling, analog joystick ports
MB MegaBus processor-direct bus slots
6U 6U VME bus slots, second serial port
FC Motorola 56000 DSP, 16 bit stereo audio, much enhanced video

TOS:
Highest built-in TOS

Models:

Name	CPU	RAM	TOS	B.I.	Extra	Comment
130 ST	8	/1	1.0	M		Never marketed
260 ST	8	/5	1.0	M		
520 ST	8	/5	1.0	M		
520 ST+	8	1	1.0	M		
520 STm	8	/5	1.2	M		
520 STfm	8	/5	1.2	FM		
1040 ST	8	1	1.0	FM		
1040 STf	8	1	1.2	F		
1040 STm	8	1	1.2	M		
1040 STfm	8	1	1.2	FM		
Mega 1	8	1	1.2	F	MB	

Mega 2 8 2 1.2 F MB
Mega 4 8 4 1.2 F MB
STacy 8 1 ??? F Laptop
STBook 8 1 ??? F Notebook
520 STe 8 .5S 1.62 FM AV
1024 STe 8 1S 1.62 FM AV
Mega STe 16 1S 2.06 F AV,MB,6U
TT 16/030 Just for developers
TT 32/030 S 3.06 F AV,MB,6U Various mem/HD configs
Falcon 16/030 S 4.?? F AV,FC Many enhancements!

:FALCON: ??.??.??
What are the specs on the Falcon?
==========

Here's some stuff I culled from the (reposted) Delphi conference with Sam Tramiel.

--- Start Quoted material ---
Here's the specs on the Atari Falcon 030:

CPU: Motorola 68030 running at 16 Mhz
32-bit Bus
Optional 68881 or 68882 FPU
RAM: 1,4, or 14 megs
Standard Atari Cartridge Port
Motorola 56001 DSP chip

Expansion Bus:

Internal direct processor slot for 386SX PC emulation, or other coprocessor

Graphics:

Super VGA graphics: 640x480 with 256 colors
True color 16 bit mode allowing a display of up to 65,536 colors
Accepts external video sync signal to allow high quality genlocking
Overlay mode for easy video titling and special effects
Overscan on TV's and ST Color monitors
262,144 possible colors
hardware-assisted horizontal fine scrolling
BLiTTER graphics co-processor

Sound features:

Eight 16 bit audio DMA record and playback channels
Stereo 16 bit digital DMA input
Stereo 16 bit DMA audio output
SDMA sound/DMA Coprocessor

Standard Ports

SCSI II port with DMA
High speed LocalTalk compatible LAN
Connector for analog RGB color (ST or VGA) or composite video
RS232C serial port
Bidirectional parallel port
MIDI IN/MIDI OUT
Stereo microphone input, miniature stereo plug
Stereo audio out, miniature stereo plug
Two joystick connectors
Two enhanced digital/analog controller/light pen connectors

Data Storage

1.44 Mbyte floppy disk drive
Optional internal IDE Hard Disk

System software

Pre-emptive Multitasking with adaptive prioritzation (MultiTOS)
Inter process communication
NewDesk desktop and eXtensible control panel
Multiple window user interface; number of windows limited
only by memory or software in use.
--- End Quoted Material ---

:ACCEL: ??.??.??
Hardware Accelerators
=====================
(Thanks to Shoou-yu Tang sytang@lamar.colostate.edu for this info.)

68000 based: ICD adspeed ST/STe
Fast Tech Turbo T-16 (16MHz)
T-20 (20MHz)
T-25 (25MHz)
68030 based: Gadget by Small SST (16MHz to 40MHz user changeable, 8 SIMM slot
68882 FPU socket, 1 expansion slot, TOS 2.0x).
Fast Tech : Tiny Turbo
Full size version

:DRIVES: ??.??.??
What should I know about hard drives and the ST?
(Thanks to Shoou-yu Tang sytang@lamar.colostate.edu for this info.)

To get a hard drive for ST, STe, Mega, Mega STe or TT(using DMA port):
1. Host adapter (convert the ST's DMA to SCSI standard):
ICD, Supra, BMS are the three major manufature. ICD has very good
software updating support and updates very often.
2. SCSI hard drive or MFM/RLL drive with SCSI adapter:
i). SCSI drive:
Like Quantum Pro80LPS, Seagate ST-xxxN series, they have a 50 pins IDC
connector, and usually say SCSI hard drive or Mac drive. (Any Mac except
Mac128, Mac512, FatMac has SCSI built in, so a drive that works with Mac
usually has SCSI interface).
No other adapter needed, just connect to the host adapter in 1.

ii). MFM/RLL drive:
These types of drive is older and used in older IBM machines. To use
them you need an adapter to convert them to SCSI. Adaptec 4000/4000A
is for MFM, 4070 for RLL drive, Emulex and OMTI also has similar cards
availible. Adaptec has stopped production for quite sometime so look for
these in used/liquidation place. (usually goes $40 to $75 each).

Connect the drive to the adapter (said Adaptec 4000) then connect the
adapter to the host adapter. (said ICD). It looks like following:

```
-------------- ----------- ------------ ----------
| MFM drive |------->|ACB 4000 |------>| ICD |------>| ST DMA |
-------------- ----------- ------------ ----------
```

3. Case, power supply and cabels for the drive system:
Unless you have Mega, Mega STe, TT and the drive is 3.5" so you will put
the drive internally, you will need a case with power supply to house the
adapter and hard drive. IBM case is very easy to get and has a lot of space
for expansion.
For older drive you need about 40 watts each drive, for newer 3.5" drive
they use about 20 watts or less, Quantum LPS drive use about 10 watts each,
make sure your power supply has more than the drives need. Again if you
use IBM case, the 150 watts power supply for that type case can drive at
least 3 drives without problwm.
Cables: DMA cable usually comes with the host adapter.
power cable from power supply to drive usually comes with power sup
SCSI cable from host adapter to SCSI drive or adapter(for MFM/RLL),
it's 50pins IDC female connector on each end with 50 conductors
cable. Should be availible at place you get the drive.
For MFM/RLL drive you will need the usual MFM/RLL drive cable:
(a 34 conductors cable and a 20pins connector, again should be
available at the place you get the drive).

Now, connect them all together. Before power up, check the connection again.
And check the jumper setting on the drive (consult the drive's manual). If you
are using more than one drive with the system, make sure only the last drive
has the terminator (either a DIP or a signle inline package of resistor, which
usually is socketed and close to the SCSI connector on the drive circle board.
Remove the terminator from other drives. [only the last drive should have the
terminator]

Software usually comes with the host adapter, or you can FTP atari's AHDX5
from ftp sites.

:FLOPPY: ??.??.??
Can I use 1.44 meg floppy disks?

1.4 megabyte floppy drives will soon be available from Atari for MegaSTe
and TT machines. If you own an older Atari ST, there is a company which offers
a $199 kit (including floppy) to install and use the drive. (I will supply
the name next month, sorry...)

Note that Tos versions prior to 2.05 will not format a 1.4 meg floppy from the
desktop.

:GRAPHIC: ??.??.??
How can I enjoy enhanced graphics on my ST?

For stock STs, JRI makes a chip which allows a 4096 color palette.
There is also a public domain enhancement that allows 32768 colors on
older STs. This can be found as 32kcolor.lzh on some archives.

There are a number of graphics boards on the market. Here is a first pass
at listing some of them. The information is based on postings by Ben Gilbert
and Jari Lehto.

C32 board by Matrix Datensystem (Germany)
* 800x608, 256 colors
* all ST/TT models
* 256k, 512k and 1meg versions

C75Z board by Matrix Datensystem (Germany)
* 1024x768, 256 colors
* Mega ST or STe, TT VME Buss

(Matrix GmbH has over 15, maybe over 20 with all versions, different
graphics boards available, from hobbyist to professional, from CAD
to GenLock and digitizing.)

ISAC board by Dover Research Company (U.S.)
* 1024x768, 16 colors from palette of 4096
* makes hi-res look like ST low res, just with a huge window
* Mega ST buss
* Dover Research Co. (612) 492-3913

The Imagine by Wittich Computer GmbH (Germany)
* 1024x768, 256 colors
* Mega ST only

(Versions available for all ST/TT models. Several possible resolutions.
Reasonable price, but slow and not very compatible..)

Crazy Dots by TKR (Germany)
* 1024x768, 256 colors
* Mega ST only

(1280x800, 256 colors out of 16.7 million color palette. 1664x1200 for
both 16 color and monochrome. True color option available. Mega ST,
Mega STe and TT.)

reSOLUTION SuperVGA by GengTec (Germany)
* 8 resolutions, 320x200 through 1600x1200
* 16 colors without driver, 256 out of 256,000 with driver
* 1 mb RAM
* uses a standard VGA monitor
* Mega ST or regular ST
* available in U.S. from Rio Datel, 1-800-782-9110, (702) 454-700

(1024x768 is the highest resolution with 256 colors. Driver is called
Multicolor VGA option. Compatible with NVDI and Blitter. Multisync

monitor recommended.)

AlberTT
* like ISAC card, but specific for TT VME buss

MegaScreen
* 832x624 monochrome
* connects to MegaBus
* works with Spectre

Reflex
*1024x1024 with SM124 monitor
*2048x2048 possible with expansion
*usable with most big-screen displays

ODIN by Marvin AG (Switzerland)
* external expansion
* gives TT-resolutions to a regular ST

Cyrel
* RISC-based card
* extremely costly

Here's a few more cards, available from OverScan GbR, Saentisstrasse 166,
1000 Berlin 48, West Germany, ++49 30 721 94 66, ++49 30 721 56 92 (FAX),
++49 30 727 05 6 (Mailbox, language: German)

Autoswitch OverScan for the ST (NO STE compatibility) is DM 129.--, you
don't have to buy a new monitor. The maximum resolution on a SM 124
is variable, but in most cases at about 732*480.
AutoSwitch OverScan TT is a VME board. It's about 249.-- DM, you also can use
your old monitor, but it only works in the TTs five color modes
(3 ST-compatible modes, 2 TT-modes). Resolutions are variable, ask
OverScan about the values for your monitor.
Falcon ScreenBlaster blows up your Falcons resolution to a maximum of nearly
900*600 on SVGA-monitors. It'll be shipping as soon as Falcon030s
become available, and the pricing will be near 150.-- DM.

Graphics cards for which information is sought:

OmniChrome board by Omnimon Peripherals

JRI GenLock

Atari/Lexicor 24 bit color card

Jari Lehto proposed the following recommendations:

Low budget SVGA - reSOLUTION
Professional high-end use Cyrel (or is it Cyrix?)
Hobby or semi-pro DTP Reflex
Hobby DTP MegaScreen
To obtain TT resolution ODIN

:JOY: ??.??.??
What joysticks work best with the Atari ST?

The Atari ST works with joysticks with a 'standard' D-Socket. IBM-style joysticks, Apple joysticks, and Nintendo joysticks will -not- work.

Some recommended joysticks:

Konix Navigator - "best .. if you want to use it for any length of time"
Gravis - "responsive ... great for games like MidiMaze"
WICO - "strong reed switches, hard plastic and metal components"
Atari - "FAR more controllable and responsive than other, more durable units"

:MODEM: ??.??.??
What modems work with the Atari ST?

Any external modem should work fine with the Atari ST-series of computers. You will need to purchase or build an RS-232 cable. Be sure the cable is capable of establishing DTR with your modem, as many telecommunications packages check the status of the DTR line. (Ask your local hardware guru if you don't know what DTR is...)

The ST can connect to modems at up to 19,200 baud. Practically, you will purchase either a 2400-baud or 9600-baud modem. The cost of 2400-baud modems has dropped so much in the past few years that you should not even consider a slower modem. Believe me, modem speeds under 2400-baud are going to seem SLOOOOOOOW to you!

You will probably need a serial port patch program to use high speed modems on your ST; most versions of TOS have a bug in CTS/RTS handling.

:MONITOR: ??.??.??
What should I know about monitors and the ST?

The monitor is your connection to the ST. Without a monitor, you're typing blind. (Unless, of course, you have an RF modulator on your ST and attach it to your TV set. This is discouraged, as the bandwidth and resolution are pretty terrible for anything other than arcade games.)

There are three monitor choices for those of us owning Atari ST/STe equipment:

1. Monochrome monitors - these include the venerable SM124, one of the sharpest monochrome monitors on the market. Street price is about $150, used monitors should run around $80-90. You can also purchase a 19" monochrome monitor. This gives you a 'big screen' to play around in, and is best for work with DTP and CAD systems. The price is a bit high at $1500+, and you'll need a plug-in board, which is generally set up for the Mega ST machine.

2. Color monitors - including the SC1224 in all of its incarnations (JVC and Goldstar being the primary vendors). The newer monitor, the SC1435, has a 14" screen and stereo sound.

3. Multisync monitors - these monitors provide monochrome and color access in one monitor. The street price is around $450, about $100 more than a standard Atari color monitor. You need to reset your computer to change resolutions. In many cases, a nice little switch box is provided (or you can build one) which does this for you. Examples of multisync monitors include the OMNIMON RAINBOW MONITOR.

There are any number of monitor choices for those owning Atari TT equipment, although they all boil down to 'multisync VGA'. There 14" color VGA monitor from Atari is quite nice, as is the 19" monochrome monitor. Any standard 14" multisync VGA monitor will do as well. Forget moving your SM124 or SC1224 monitor to your new system, the cabling and electronics is just not going to work.

:PCEM: ??.??.??
How can I turn my Atari ST into a PC emulator?
==========
(Thanks to Shoou-yu Tang sytang@lamar.colostate.edu for this info.)

Supercharger is the only external PC emulator with 8MHz V30 and 1MB RAM in a nice lunch box. It connects to ST's DMA port and defaults as device 3. It's powered by external power supply. Has 8087 socket and one expansion slot. The 1MB RAM can be used as RAM drive by ST when the IBM side not used.

:SPECTRE: ??.??.??
How can I turn my Atari ST into a Macintosh emulator?
==========
(Thanks to Wayne (trek@ihlpb.att.com) for this info.)

Product: Spectre GCR from Gadgets by Small, Inc
40 W. Littleton Blvd
#210-211
Littleton, CO 80120
Retail: $299.95

Description:
The Spectre GCR is a combination of software and hardware that allows the Atari Mega/ST/STe/TT line of computers to emulate an Apple MacIntosh Plus(tm) Computer. The emulation is so good that most Apple software runs out of the package using your Atari Disk drives to read in the Mac software. It does all of this while running 20% faster than the program would on a MacIntosh Plus and provides you a 30% larger screen area.

The Spectre GCR is a combination of software (written by Gadgets by Small, Inc), a cartridge (also from Gadgets), and a pair of 128K Apple ROMs (from either a MAC 512kE(tm) or Mac Plus - part numbers 342-0341 and 342-0342 which you purchase separately from an Apple source.) The Apple ROMs can currently be purchased for around $150. MacIntosh documentation and software, including the operating system (referred to as System/Finder), are also required to round out the package.

The Spectre software is currently at release Version 3.0. Gadgets supplies fairly frequent updates to allow you to keep up with the Apple OS releases.

The Version 3.0 update retails for $20. Version 3.0 supports 15 of the 128K OS releases up to, but not yet including System 7 releases.

Spectre software supports Mac formatted disks (including formatting your own) with your Atari drives, Mac sound, large screen displays (1280x960) Mac harddisks via SCSI through a Megatalk board (retail $299.95 from Gadgets) or through an ACSI-SCSI host adapter (my Syquest works beautifully- and the excessive use of disk accesses in Mac software will have you wanting a hard drive). Spectre 3.0 also supports DOS Mounter and Apple File Exchange if you are needing MS-DOS data disks for Mac work. Language configuration support, keyboard support, A4 paper size support for Lasers have also been added to 3.0.

Running Spectre:
The feeling you will get when you see your Atari transformed into a MacIntosh with a decent screen is indescribable. The extra flexibility that you get will also make you feel more confident in the greatness of your Atari. You will also get to see some of the frustrations with one of the other sides of the fence - frustrations like excessive disk access, remembering not to remove/change a disk unless the OS tells you to, etc.

Speaking of changing disks, there are major differences in the operating philosophies of an ST and of a MacIntosh. You really must read the documentation that comes with the Spectre GCR (and I for one found that a real delight. Dave and Sandy have a very different approach to software documentation that makes it enjoyable reading.) You should also read the Mac Operating System docs. One other reference you may need if you are going to do much with Mac software is one of the reference manuals referred to as the MacIntosh Bible.

If you ask an Apple dealer if a particular piece of software runs on a GCR, don't figure you will get a straight answer. They won't know. The current compatibility list from Gadgets lists about 450 programs and their release numbers that have been tried and found to work with Spectre GCR. In general, if a piece of software won't work with the GCR, it is probably becuase of copy protection. Most serious Mac software is not copy protected.

One last note - earlier versions of the emulator exist that were not capable of reading Mac disks directly. It's a capability you will want.

(Thanks to Shoou-yu Tang (sytang@lamar.colostate.edu) for this info.)

Spectre GCR is the best availible, you need to obtain a set of 128KB ROM from Apple (they are used in Mac 512KE and Mac Plus, noted that Mac512 use older 64 KB ROM which is not good) to fully utilize the device. Also it's recommanded to use it with MONO monitor and at least 2MB RAM. The Spectre software takes about 300 some KB of memory, so on a 1040 there is not very much left for Mac, especially after the Mac system is loaded. 4MB memory and MONO is best.
It can read/write Mac disk direct using ST's drive (double side drive, as most Mac drive is double side). With DOS mounter or software like that you can read /write ST, IBM disk from the Mac desktop as well (don't try to run the ST, IBM

binary. It's only for file transfer). Or you can use Apple File Exchange to read/write ST, IBM disk.
Syatem 6.0.5 runs fine, system 6.0.6, 6.0.7 runs also. But system 7 will not run with it.

:UPGRADE: ??.??.??
Can/should I upgrade my ST?

The answer depends on the type of ST you currently have, and what you want to do in the future. Be aware that there are a large number of modifications one can perform on the venerable 1040ST, and that newer machines are coming down in cost so much that to obtain a certain feature it may be cheaper to purchase new than to upgrade.

1. Memory - most ST machines may be upgraded to 4 megabytes. The newer STe machines use either SIP or SIMM

2. TOS - for those still running TOS 1.0, now is the time to consider an upgrade. TOS 1.4 has been around for at least 2 years now, and is -much- faster (and safer) for those using hard drives. TOS 2.06 is available as a hardware upgrade to ST and MegaST machines for about $150 from CodeHead

I talked about Current Notes benchmarking an Atari TT being 30-40% FASTER
than a 486DX-25 and totallly beating it in video performance (VGA) (back in
1990) and this dude responded...

>This must be a load of rubbish because I used to regularly use a 486-33
>at work and a TT at home to compile a fairly large C program (40,000+)
>and the 486 ripped through the compilation (Zortech) while the TT just
>slowly muched its way through - if I had a choice I'd compile on a
>486 rather than a TT.

Ok, think now, did you use the exact same C compilor on both computers?
I didn't think so. Cause if you used a fairly top end compiler, and the TT
had a PD compilor then of course you'll have a big difference in compiling
speed. Did you use Laser C or what? Point being, use the SAME program on
different computers if you want a somewhat relevant (and accurate) benchmark.

>As for graphics, yes maybe the TT graphics are faster than your average 486
>setup BUT the TT graphics are complete crap in comparison. And yes one could
>buy a graphics card for the TT but have YOU got a leg and arm to spare.

Hello? Do we have our thinking caps on? I said this article was written in
1990 when SVGA was either nonexistent or not as prevalent (sp) in the PC
world. Point being, local bus VGA performance...standard on the Atari TT

Excerpts from netnews.comp.sys.atari.st: 6-Jun-93 COPIER ATARI ST <->
IBM PC Jeff Spink@uttsbbs.uucp (384)

> Atari and IBM use the same format, you should have no problems copying files.

Actually, the ST has no problem with PC-formatted disks, but the PC
doesn't like disks formatted on an ST unless they have a PC bootsector
(which can be written with DC Format). Or just format everything on a
PC, in which case both machines will be happy.

This .sig is $hareware. If you use it for more than a
month, send me all of your money, then see a
psychologist. Or kill me.

} YOU got a leg and arm to spare.
--

This I find quite amazing, considering the limitations on the bus
throughput on the PC. Is Zortech an incremental compiler or something?
And what was the TT compiler used? I've always considered 486's to be
terminally slow when compiling (though I use gcc on them, when I have
to).

>would spawn off xyz)

I guess I should throw in that the same thing can happen when
using ConNect as well - if MiNT or MTOS is loaded, then you can set
the option to do a background download (you'll still be "within" Connect,
but you may use it's shell or RUN other program features to get
around that).

In the case of using Mint/MTOS with background downloading with
any term program, it might be useful to treat NICE.TTP as the
"download protocol" with your zmodem.ttp as a parameter to that -
at least that way you may adjust the timing used up by the
protocol...

Source record: 204883

I have friend who is a Publisher, lives in Sweden and
uses Atari professionaly. This is not common in sweden,
therefor I am anxious to assist him.
He have a TT030/8 with a 48Meg seagate ST157N internally.
on the outside on the same SCSI-chain he had an EPSON GT8000
colour scanner and an Ultre Setter DTC3000. This worked fine,
but of course he needed more harddisk-space. He bougth another
240Meg seagate ST3283 and connected on the SCSI-chain, suddenly
it was impossible to save on any of the harddisks.
It works perfectly as long as you only reads from them, the Setter
and scanner works fine but you can't save the result.
Something really strange is that it is possible to save before
you have used the scanner, but not after, unless you boot again.

The chain is in the following order computer
unit 0 internal disk
unit 1 external disk
unit 3 scanner
unit 4 photosetter

The reason that there is no unit 2 is that it is difficult
to change id on the photosetter.
The photosetter must be last on the chain cause there is only
one SCSI-connector.
There is a terminator in both ends of the chain.

307. RECLAIM (claim back 2 clusters on floppies) sent to a.a.

Newsgroup: comp.sys.atari.st
Date: 1993-06-07 14:42:07 UTC
From: wabe@ukc.ac.uk
Message-ID: <4677@eagle.ukc.ac.uk>
Source record: 204881
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I have just downloaded a new utility (RECLAIM.ZOO) to a.a. @umich.
The text file begins as follows and tells you what it's about:
Cheers,
W. Alan B. Evans.[wabe@ukc.ac.uk]

------------------- From RECLAIM_V2 textfile ---------------------------

For some reason best known to Atari, TOS "wastes" 4 sectors (or 2
1024 byte clusters) of formatted disk space. For example, with the standard
double-sided Atari format we have 1 bootsector, 2 sets of fats each 5
sectors long and a root directory which is 7 sectors long. The disk is
formatted to 80 9-sector tracks on both sides i.e. 1440 512-byte sectors
in all. Since the "disk management" accounts for 18 of these, one might
reasonably expect there would be 1422 left over to hold data i.e. we'd
expect 711 clusters of data. But NO! - as is well-known there's only 709
clusters available for data. What has TOS done with the other 2? I'm sure
I don't know - I've never seen any explanation for this documented! But
there _MAY_ be a good reason - and, IN CASE THERE IS, and in any case
as this software is FREEWARE, I give NO GUARANTEES WHATSOEVER for any
consequences that might arise out of using RECLAIM. Therefore, it would
be wise to be wary (esp. with valuable data) until one has gained full
confidence in the usage of RECLAIM. All I can say is that I have
personally been using RECLAIM for some while with no adverse-effects.

The idea for RECLAIM is originally in the RDY sourcecode of Mark
Williams Co.'s "RDY" ramdisk utility. Whilst upgrading the latter recently
(Version_4 of RDE is now available at a.a.) I noticed that a little trick
which the author of RDY called a CLUSTERHACK allowed the ramdisk to reclaim
these 2 lost clusters back from TOS. Basically the strategy is exceedingly
simple viz. alter the boot parameter block info to signal a total sector
number which is 4 more than actually exists and to MARKBAD the last two
FAT clusters. It occurred to me that this might also work on Floppies
and, indeed, it seems to. However I know of no formatter program that will
format floppies in this "RECLAIMed" state.

You can use a disk editor (DISK DOCTOR, KNIFEST etc.) to do the
alterations. However, altering the format with a disk utility involves some
intricate calculations to locate the last two fats' positions etc. etc.
and a small error could cause loss of data. RECLAIM.TOS simplifies & speeds
up this task. At the prompt you simply insert a normally formatted disk
and RECLAIM will do these conversions and modify the disk so that you will
end up with 2 kbytes more of free space on it. Of course, it checks to see
if the disk has previously been altered and, in that event, will tell you
and alter nothing. Note also that disks containing data can also have

their missing sectors RECLAIMed - with no harm to the data.

etc. etc. .... Rest of documentation ommitted.

308. Modem recommendation

[nothing worth quoting]

Who's foaming at the mouth? YOU are. I didn't even MENTION the Atari ST in that posting, and I wasn't trying to be 'cute'. I was just raving about a game program that I had recently had the opportunity to spend several hours playing.

And, believe me, it DOES make a difference what level of hardware you happen to have when it comes to playing games like "The 7th Guest". It says so right on the box. A 386-based machine just isn't fast enough, and it was apparent from game-playing that a better sound card and a faster CD-ROM drive (than the ones on the 486 on which we were playing) is needed. It was a bit annoying to hear sound a second behind the video.

I feel sorry for you Bob. You apparently can't read ANYTHING from certain people anymore without immediately coming to the conclusion that it an attack on everything you appear to hold sacred.

>
>Um...how many people do you know who use DOS very much anymore?

I know a _lot_ more people that use DOS than use OS/2. Don't you? :)

>You are essentially ragging on the PC world because of limitations on
>their 1st and 2nd generation machines/software.

I'm ragging on the PC because I _own_ one. Now it's my God-given right. :)

>The silly limits which you keep espousing as evil pc-isms will
>probably linger on for those who don't want to get a real OS ...

Oh, "OS/2 Rules", eh Christopher? In the _real_ world, when someone buys a
386 or 486 PC, 99 times out of 100 they will get DOS & Windows installed with
it and hence, that stupid 640K barrier _does_ exist for them. Good or bad,
that's the real world as it exists today. Gee, if IBM wasn't so Atari-like,
maybe they could _market_ OS/2 properly. <Ooooh, that hurts, eh Chris?>

>but to lump all intel boxes into that mold seems rather silly,
>at best, and intellectually dishonest, at worst.

Perhaps if you had _read_ my post, instead of getting on your OS/2 highhorse,
all this would not have been necessary. My original post read:

>> Sure, OS/2 and Windoze helps isolate the user from memory partitions, but
>> it's still there in full fiery force under DOS.

So please tell us, Chris... what is silly or dishonest about that?

Methinks your views best belong in alt.os.os2.advocacy. Can we return to our
ATARI discussions now, please? Sheeesh.

There's a shareware program called MIDIX32 that does just what you
want. I'm pretty sure there's a copy in the archives.

Typically consoles are sold very near cost, virtually thrown away. This is a very good marketing move... it entices you to buy the machine, then they make all their money on cartridges/cd's. That's exactly what Sega and Distendo are doing. So the $200 is probably raw parts value. Of course, it won't be available for a long time, so they have lots of opportunity to change the price. :)

This is to the author of MINIX FS.

I talked to Atari after reading your statement that it would be nice to include your FS as part of the new OS.

The person I talked to seemed interested and said that you should contact Eric (The author of MultiTos) here on the net to discuss it.

Anyway, good luck.

Paul F.

>

True it wasn't the same compiler. I used Lattice 5.5 on the TT. But the speed difference is so great that I can't imagine that it would be the compiler that was slowing down the computer. Not only that but the 486 felt much faster in most things, compiling was the most visible because that always took the longest. When the TT was first anounced, I guess there wasn't a computer around at the price that could match it. But by the time Atari got it out at a reasonable price it was too late and competition (PCs in this case) had cought up. The reason why I bought a TT was that I need something faster but still compatible with my ST.

>
>>As for graphics, yes maybe the TT graphics are faster than your average 486

>1990 when SVGA was either nonexistent or not as prevalent (sp) in the PC
>world. Point being, local bus VGA performance...standard on the Atari TT
>
>Allen Pouratian

Yes I'm afraid I was thinking. In the UK you couldn't get a TT until late 91/92. Before that the TT was very expensive and very difficult to get hold of. By the time the TT was available at a reasonable price SVGA was about and price dropping fast.

What happenned to the TT is about to happen to the Falcon, too little too late and too expensive. How much does a Faclon cost in the UK now, fully loaded, hard disk, monitor and *at least* 4MB of ram, it must be approaching 1500 pounds, and that's a computer you can't expand - not even the memory without throwing away 4MB first. Last summer the Falcon sounded GREAT, this summer well it's ok I suppose but the cost? If the price of the Falcon come down this summer, I'll probably get one, but I wish there was proper memory expansion (at least they've got the hard disk side sorted out).

I don't think Atari understand todays computer market - sorry this is diverging from the main topic. The main point is that, Atari's top end computer, the TT, is slow and underfeatured compared with present day PCs (and also too expensive - quite a bit more expensive that a decent 486 set up - I know I've a friend thatputs 486s together).

318. Latest gdb and miscelanous bitching

Newsgroup: comp.sys.atari.st
Date: 1993-06-07 18:06:57 UTC
From: llunch@randell.cba.csuohio.edu
Message-ID: <1993Jun7.180657.7488@news.csuohio.edu>
Source record: 204893

```
Where can I get the latest mint version of gdb, preferrable as
an st compatible binary. I got gdb35src.zoo from atari.archive, and
have had nothing but trouble with it. It looks for something called
atarierr.h -- I was able to find a file with this name in a mint src
distribution. Then it looks for uproc.h. I have no idea about this
one. Has anyone been able to compile dld (the gnu library to
load object modules into running programs)? It has several '#ifdef atarist'
statements; however, it expects an a.out.h that defines things much
differently than mintlibs st-out.h. Yes, I've had a really fun
weekend pondering these matters. If anyone has the answers please
```

Hi folx! I thought this might interest some people.. esp. those who want
to write low level device drivers, and TSR's.. and maybe it will help clear
up some questions about the Falcon, but i think more questions will be
caused because of it.. but oh well :^)

I am open to comments, questions, etc..
Flames will be cheerfuly filed away in /dev/null

-Dan

| |10 - 25033hz frequency ------------------+-+|
| |11 - 50066hz frequency ------------------+-'|
| |Samples are always signed. In stereo mode, |
| |data is arranged in pairs with high pair the|
| |left channel, low pair right channel. Sample|
| |length must ALWAYS be even in either mono or|
| |stereo mode. |
| |Example: 8 bit Stereo : LRLRLRLRLRLR |
| | 16 bit Stereo : LLRRLLRRLLRR (F030) |
| |2 track 16 bit stereo : LLRRllrrLLRR (F030) |
-------+-----+-------------------------------------------+----------
###############STe Microwire Controller (STe only!) ###########
-------+-----+-------------------------------------------+----------
```

```
$FF8922|byte |Microwire data register |R/W (STe)
$FF8924|byte |Microwire mask register |R/W (STe)
| +----------------------------------------+
| |Volume/tone controller commands(Address %10)|
| |Master Volume 10 011 DDDDDD|
| |Left Volume 10 101 xDDDDD|
| |Right Volume 10 100 xDDDDD|
| |Treble 10 010 xxDDDD|
| |Bass 10 001 xxDDDD|
| |Mixer 10 000 xxxxDD|
| +----------------------------------------+
| |Volume/tone controller values |
| |Master Volume : 0-40 (0 -80db, 40=0db)|
| |Left/Right Volume : 0-20 (0 80db, 20=0db)|
| |Treble/bass : 0-12 (0 -12db, 12 +12db)|
| |Mixer : 0-3 (0 -12db, 1 mix PSG)|
| | (2 don't mix,3 reserved)|
| +----------------------------------------+
| |Procedure: |
| |Set mask register to $7ff |
| |Read data register and save original value |
| |Write data register |
| |Compare data register with original value, |
| |repeat until data register returns to |
| |original value to ensure data has been sent |
| |over the interface. |
| +----------------------------------------+
| |Interrupts: |
| |Timer A can be set to interrupt at the end |
| |of a frame. Alternatively, the GPI7 (MFP |
| |mono detect) can be used to generate |
| |interrupts thereby freeing up Timer A. In |
| |this case, the active edge $FFFA03 must be |
| |set by or-ing the active edge $FFFA03 with |
| |the contents of $ff8260 as follows: |
| |$FF8260 - 2 (mono) or.b #$80 with edge |
| |$FF8260 - 0,1 (colour) and.b #$7f with edge |
| |This will generate an interrupt at the START|
| |of a frame, instead of at the end as with |
| |Timer A. To generate an interrupt at the END|
| |of a frame, simply reverse the edge values. |

321. Re: Atari Falcons in Sacramento

Newsgroup: comp.sys.atari.st
Date: 1993-06-07 18:45:22 UTC
From: crissman@btree.uucp
Message-ID: <1993Jun7.184522.25200@btree.uucp>
Source record: 204898

Yes, I've seen one in San Diego, but I'm not supposed to know that
I've seen it. "It's just a 1040 that I've worked on a bit, don't
ya know," he said.

"What about that 9-pin modem connector, or that odd whine on start-up
that sounds suspiciously like an internal hard drive? How can all that
fit inside a 1040ST?" I wanted to know. "Gosh, you don't look so good,"
he replied. "Are you feeling like you're ... um ... hallucinating
just maybe a little bit, hmmmm?"

"And look at that new desktop," I continued, "and all those wonderful
colors! Certainly, this cannot be a mere 1040ST!"

"Well, you're right," he finally admitted. "I did a minor upgrade from
TOS 1.0. Now will you *please* tell me you see a 1040 _and_only_a_1040_
in front of you so I can demonstrate the true color mode?"

Finally I got his drift, don't ya know ....

Here is a nice example of how Bob R. treats people too...

Bob,
Just because you have one insult here, doesn't mean that
you should go ahead and judge the whole community. Take off your
blue-tinted lenses and use a little logic...

Later,
Bernard

323. Re: Interesting speed note (486, 68000)

In article <36913@castle.ed.ac.uk>, eang62@castle.ed.ac.uk (Herbert Sauro) writes:

} What happenned to the TT is about to happen to the Falcon, too little
} too late and too expensive. How much does a Faclon cost in the UK now,
} fully loaded, hard disk, monitor and *at least* 4MB of ram, it must be
} approaching 1500 pounds, and that's a computer you can't expand - not
} even the memory without throwing away 4MB first. Last summer the Falcon
} sounded GREAT, this summer well it's ok I suppose but the cost? If the
} price of the Falcon come down this summer, I'll probably get one, but I
} wish there was proper memory expansion (at least they've got the hard
} disk side sorted out).

Christ thats one hell of a monitor you're going for! RRP of a falcon
is #799, you can get #50 off if you pay cash, (and smile nicely etc.)
Go for a cheapo vga monitor - don't need svga, and you're talking
around #950. Possibly cheaper. This is the 4Mb 85Mb HD version.

} I don't think Atari understand todays computer market - sorry this is
} diverging from the main topic. The main point is that, Atari's top end
} computer, the TT, is slow and underfeatured compared with present day
} PCs (and also too expensive - quite a bit more expensive that a decent
} 486 set up - I know I've a friend thatputs 486s together).

Agreed, the TT doesn't compete with the 486/66 of today. Perhaps when
the 040 machines come out we'll see a bit of a difference. Atari need
a top-of-the-range machine (not so people will buy it, just so people
can see they've got one. This is more important than people think).

Remember that the 040 has always been clock-doubled, Motorola just
didn't make such a big deal of it as intel. So if Atari bring out a
Falcon 040 (and I think they will), run it at 33MHz, and provide a
32 bit bus (which they must, since 040's unlike 030's cannot slice
their r/w accesses in half to use a 16 bit bus), then you'll have
something comparable to a 486/66, and which ought to be faster really
since the 040 is more efficient at the most common ops than the 486.
On a 32-bit bus, the *neat* programmable graphics resolutions will be
able to go much higher as well, so effectively you'll have localbus
SVGA thrown in for free, with the blitter chip providing for the
2D accelerated graphics. Perhaps not quite up to localbus S3 or
Weitek P9000 standards, but you pay quite a lot for those...

A lot of `if's there, but hell, mankind is cursed with hope, and
there's nothing above thats infeasible - doesn't the TT have a 64-bit
graphics bus ? (I seem to remember someone claiming this once.)

Actually I'm expecting the 040 to appear just around the time I get
upgraded to an RA next April (he says, putting head on the line :-)

Simon.

324. Re: RECLAIM (claim back 2 clusters on floppies) sent to a.a.

Newsgroup: comp.sys.atari.st
Date: 1993-06-07 18:58:57 UTC
From: bobf@milne.geology.yale.edu
Message-ID: <1993Jun7.185857.21095@cs.yale.edu>
Source record: 204899
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

W.A.B.Evans (wabe@ukc.ac.uk) wrote:
: I have just downloaded a new utility (RECLAIM.ZOO) to a.a. @umich.
: The text file begins as follows and tells you what it's about:
: Cheers,
: W. Alan B. Evans.[wabe@ukc.ac.uk]
:
: -------------------- From RECLAIM_V2 textfile ----------------------------
:
: For some reason best known to Atari, TOS "wastes" 4 sectors (or 2
: 1024 byte clusters) of formatted disk space. For example, with the standard
: double-sided Atari format we have 1 bootsector, 2 sets of fats each 5
: sectors long and a root directory which is 7 sectors long. The disk is
: formatted to 80 9-sector tracks on both sides i.e. 1440 512-byte sectors
: in all. Since the "disk management" accounts for 18 of these, one might
: reasonably expect there would be 1422 left over to hold data i.e. we'd
: expect 711 clusters of data. But NO! - as is well-known there's only 709
: clusters available for data. What has TOS done with the other 2? I'm sure
: I don't know - I've never seen any explanation for this documented! But
: there _MAY_ be a good reason - and, IN CASE THERE IS, and in any case
: as this software is FREEWARE, I give NO GUARANTEES WHATSOEVER for any
: consequences that might arise out of using RECLAIM. Therefore, it would
: be wise to be wary (esp. with valuable data) until one has gained full
: confidence in the usage of RECLAIM. All I can say is that I have
: personally been using RECLAIM for some while with no adverse-effects.

This was a bug on Atari's part. When they found out about it, they
decided not to fix it, out of concerns of incompatability. Consider
the situation. Suppose they had fixed it by making newer Ataris use
all the clusters. You write a floppy on a new Atari, using all the
clusters. Suppose you now try to read it on an old Atari. Chances
are, you wouldn't be able to finish reading the disk, since the old
buggy Atari will decide you've written past the end of the disk.

Suppose instead, Atari had changed the format routines to do as
RECLAIM.ZOO does. Now, you format on a new Atari. Consider what
happens when you write to that disk on a PC!! This would forever make
Atari- formatted disks incompatible with the PC world. This option
does sound like the best available to Atari, but I can still see why
they decided to do nothing.

In the meantime, if you feel that 2K per disk is that important, I see
now reason why using RECLAIM should cause any problems, as long as you
don't give those RECLAIM-formatted disks to your friends.

325. Minix FS w/ M-TOS

Newsgroup: comp.sys.atari.st
Date: 1993-06-07 19:11:18 UTC
From: neurom@u.washington.edu
Message-ID: <1v03smINN6mo@news.u.washington.edu>
Source record: 204801

As a (soon to be) new Falcon owner, I was wondering if it was possible to install MinixFS on to of MultiTOS. Also, could anybody out there who is intamate with MultiTOS 1.x / TOS 4.x say if all of TOS is based on MiNT, or just the MultiTOS portion? Reason: Could MinixFS load into an FS socket in TOS, or just M-TOS?

>at least 16 MIPS.

The 3210 is _not_ the same as the 320E15. The 66 Mhz 3210 will
do floating point arithmetics about 30 times faster than a 25 Mhz
68040 CPU. The card will sport the 3207 later, which is even
faster.

>A nice thing about the card though is that it shares memory with the main-cpu.

Plus the fact that it has up to 16 Mb of dedicated DSP memory.
Quite a lot compared to the 96 Kb (?) in the Falcon. BTW, your
talk about "high-end" computer is false. The A4000/030 is in
the same price as a Falcon with HD + extra RAM.

>bytes of memory! That's what NeoDesk 2.0's "About..." window tells me.

I can see the problem by looking at your list of installed software. All of your resident programs (the ones in your AUTO folder) eat into your available RAM. As I recall, a 1040 has somewhere over 800K of free RAM with nothing installed (the operating system grabs some). Your 196K RAM disk accounts for another 196K. I don't have NeoDesk so I don't know how much memory it eats, but I'd guess it takes a pretty healthy chunk all by itself. Add in a few desk accessories and suddenly you'll find you've eaten a sizable chunk of the total RAM.

>I hooked up an external modem to it... It connected and ran alright
>(though the modem program, Flash, was a bit weird) but refused to
>download. Xmodem kept getting CRC and checksum errors. I tried
>changing all the parameters on both sides. Does anyone know a way to
>get zmodem into this program? Or how to get xmodem to work? Or can
>anyone reccommend a better (hopefully PD/Share) term program? And is
>Kermit and Emacs available for the ST? I would hope so...

I used to use Flash and recall that there are some shareware programs available to let you run Zmodem with it. I now use Uniterm (PD, available all over), and it has Kermit built in which works fine. If you want to download using Zmodem and don't need a fancy terminal emulator, check into Dterm (also PD).

There are several versions of emacs around, from microemacs to the full blown GNU emacs which requires at least 2 megs of RAM and various voodoo mantras to install it.

>As for the ST, it reports TOS .19. That's bad, right? How can I
>upgrade that? And do I need to upgrade it?

What are you using to check the TOS version? There is no TOS .19. that I know of. You'd do best to have TOS V1.4 or higher installed. V2.X and higher require a daugherboard to install.

You could work with GSZRZ.ACC from Xenia Software, Michael Ziegler. It's Shareware and costs about 30,- Marks. You could use it as an ACC or PRG and it runs in a Window, so it will run in the background.
But there's a problem: You couldn't copy this version freely, therefore you have to ask Michael directly.

Here is his adress:

>clusters. Suppose you now try to read it on an old Atari. Chances
>are, you wouldn't be able to finish reading the disk, since the old
>buggy Atari will decide you've written past the end of the disk.
>
Very interesting! - but still Atari _could_ have fixed the bug
and, to keep owners of older Ataris (who receive "full" disks from owners
of newer Ataris) happy, they could have made available the equivalent
of RECLAIM.TOS. Then even those with older Ataris could read all the
clusters. Further the newer machines should not complain either if they
see a RECLAIMed disk - for the 2 extra clusters which they _could_ read
(if only they existed!) are MARKED_BAD.

So I'm afraid the mystery remains (for me at least).

Cheers,
W. Alan B. Evans

336. Atari Archive demos

Newsgroup: comp.sys.atari.st
Date: 1993-06-07 22:47:54 UTC
From: Steven Gemma <sg47+@andrew.cmu.edu>
Message-ID: <Mg4wKOO00ioW8FFIED@andrew.cmu.edu>
Source record: 204813

I am an avid Atari fan (much to the amusement of my friends),
waiting for a Falcon. In the mean time, I must make do with a
1 Meg 520STfm with TOS 1.0. I want some neat demos to show
off the machine. There are a ton of demos on atari.archive, but
everytime I download one, it doesn't seem to want to work on
my computer. Does anyone have a list of the requirements for
each demo (Ste, 1 meg or more, TOS > 1.0, etc.)? I want
something to show my friends so they don't think all it can
do is play Combat and Space Invaders.

Thanks.

-Steve

[lots more...]

Welcome to the newsgroup. The memory issue -

You have 1024kbytes of RAM. Neodesk uses about 150k, you also have 200k ram disk. The video hardware needs 32k and parts of the OS load into RAM (150k?). You may have some DAs and TSRs which means you only have 350k left, not enough for serious work.

For comms, try Connect which is shareware. The ST has some serial bugs. There are fixes around but it depends on the OS version. Let us know which OS version (the simplest way is to look at the first entry on the desk menu on the built-in desktop, and quote the copyright date).

I'm sure others will have some more to say...

Here again is a listing of what I would like to sell.
Make an offer if you don't agree with my price.

ATARI MEGA ST2.....$325/obo
Atari Mouse, Keyboard

Color Monitor (SC1224).....$150/obo

ICD 48meg hard drive (Seagate, dual HD case)...$275/obo
Various Utilities on drive(graphics, sound, etc.)

All Original Boxes

Software includes:
Word Writer ST / Swiftcalc.....$15
GFA Basic/Compiler 3.5.....$50
GFA Raytrace.....$15

GAMES:Currently, all of these are SOLD
These three are in one game pack.....$15
Blood Money
Rocket Ranger
Speedball

Shadow of the Beast.....$5
Falcon (1.0 and 1.2, mission disk 1)..$20
Alien Syndrome.....$10

$35 for all the games

Asking $600 or best offer for all that is left
Buyer pays shipping

Email me at fymah@essex.ecn.uoknor.edu

341. ICD hard disk problem

Newsgroup: comp.sys.atari.st
Date: 1993-06-08 00:10:36 UTC
From: kosmatoo@carre.iro.umontreal.ca
Message-ID: <1993Jun8.001036.12565@IRO.UMontreal.CA>
Source record: 204819

Greetings.

Problem : Can't access the hard disk.
Equipment: I have here a mega ST, with ICD host adaptor and Quantum 52LPS
hard drive.
Formatted: 4 partitins of 13 megs each (type: GEM)

Tried : running ICDBOOT.PRG from auto folder on drive A:\
it says "Version 5.3" and gives information about
the cache sizes.

then, clicking on icon of drive A, installing icon of
drive C. Double clicking on this new icon (capital C)
makes the desktop say something like "Drive identifier
does not exist" or "drive does not exist"

This simple procedure should have worked, right?

Tried 2 : Checking partitions with the format program, and yes,
they are there

Tried 3 : running ICDboot.prg from desktop after booting with it
and it says "can't install" (just giving you details!)

Tried 4 : ratehd on the drive works

Yesterday, I had no problem accessing the drives C: D: E: F:...

I need Ideas on how to be able to access the files on this drive.

Thank you. Please reply promptly.

My ST did exactly the same thing. I re-seated the MMU chip and
the ROM chips and it has worked ever since.

>Try to pay more attention in the future, OK..?

I'm not the person who wrote the original message, and I don't usually
jump into flame wars, but I can't help myself on this one...

I've been reading this newsgroup for four or five years, and I don't
recall reading any postings by you that weren't complaints, arguments,
flames, misdirected bashing, or completely off-topic. Maybe there was
something real special you did for the Atari community in the first
half of the decade, for which we should all be terribly grateful. If
so, I'd love to hear about it.

Meanwhile, I'll just go back to having fun programming my ST. Have
fun with whatever it is you do.

From what I've read, it costs upwards of $20,000 to make a CD-ROM...
Even at $200 a pop, they couldn't guarentee selling 100 copies (and
players) in the current Atari market.

Now, if they had something like the Sherlock Holmes disc to produce,
maybe...

Obviously, he's out of his mind. :) Using MicroSoft Visual C++ to compare
to GNU C is a bit strange, too... MS isn't exactly known for tight code
(or working code for that matter).

> defend my previous claim...

You must've changed 4 1M SIMMs for 4 2M SIMMs or something like that;
the price you pay for not having to play with DIP switches and whatnot
on a MicroChannel machine is having to tell it (or let it tell itself;
the Reference disk has an auto-configure function that works perfectly)
what's in there.

Instead of having I/O, address, and IRQ conflicts that might not get you
right away (and blow your disk away), you have to boot once with the
Reference disk. Gee, that's terrible.

I'm not a PS/2, but I play with one at work (well, an NCR MicroChannel
machine anyway).

>22-character external names for v2.00 and above (so that I don't have to
>re-release the library when v2.01 is released).

Well, it pains me to say this, but there may never be an HSC v2.x
release. Scott, you have the only version of it in the world right now,
and (as you know) there's a couple bugs in the preprocessor so it can't be
distributed as-is.

Recently, the IDE drive on my Falcon took a hit. Some errant software
nuked the boot sector on the D partition, where HSC lives. (Er, lived.)
Normally, my MSDOS machine holds a backup of everything I'm working on
(since it has the good editor anyway), but recently, I needed more disk
space, and wiped out the whole HSC directory tree, firguring it was all up
to date on the Falcon side anyway. The next day, the Falcon drive bit it.

In trying to use Atari's CHKDSK3 to manually edit the boot sector back to
what it should be, CHKDSK wiped out the partition map on the drive. (I
shoulda known better than to trust Artari-written software.) So now I
have a Falcon that won't boot at all.

I called Atari, and they told me that Diamond Edge was the One And Only
program that could fix a problem like this on an IDE drive. I bought it,
then waited over a week to get a new version shipped to me, one that was
new enough to handle IDE drives. It is NOT able to fix the problem. It
does, however, excell at displaying bombs, follwed by a locked desktop.

I'm gonna call Oregon Research tomorrow and see if they have any bright
ideas on getting their program to do the sorts of things the ads claim it
can do. If they can't help, I'm stuck with reformatting the drive (if
that's even possible, some IDE drives can't be formatted). In that case,
I will have lost all of HSC V2.x; it will take months to recreate from the
freshest (very old) backups of it I have. I don't know when (if ever) I
might get the time and energy to do that.

On a more positive note, I did have up-to-the-second backups of the two
things that *really* matter to me: Cyber Paint v2.7 and GemFast v2.0.

I don't buy that. I typically format disks that use only 3 sectors per FAT instead of the wasteful 5 per that the desktop creates. The number of clusters per disk is thus even more than the extra 2k RECLAIM would give you. I have no problem using such disks on either older version of TOS, or on MSDOS.

Yes, the minix file system driver works fine with MultiTOS (Stephen did
a good job of programming it :-)).

The minix.xfs does require MiNT, even with TOS 4.x.

OK, David.. let's try it another way...

Your point seemed to be that "state of the art" games on the PC require buying faster and more expensive hardware to run them on.. is that right?

Isn't that exactly the situation I'm in with my 520ST..? When Falcon games hit the market with "true color" graphics and DSP sound, I'm going to have to buy an expensive new machine to play them on...

Super Nintendo games won't play on a Nintendo Entertainment System, and "Dungeon Master" won't play on an Atari 130XE...

It's called progress, and it will always work that way.

I couldn't play Ultima Underworld until I upgraded to a '386, and now, thanks to your experience, I'll know not to buy "The 7th Guest" until I get a '486.

(And you're right, I interpreted your message as a "PC put-down".. sorry if that wasn't how it was intended...)

Yes, the Mega ST case was the best looking case Atari ever had.
They should have continued with it for the Mega STE and TT because their cases were ugly beyond belief and monitors didn't sit right on them.

>I wonder if they are working on an 040 Falcon....

I doubt it will matter. I see people all around me giving up on the Falcon030 right now and going over to PC's. Commodore rushed their A1200 out to beat the Falcon but met no competition. I guess Commodore are now working on something for those who just can't bear a PC or die-hard Amiga owners. Where will Atari be?

It sounds like you have come across a new (?) GEMDOS bug. If you write to a prtition and get a disk full error the boot sector of the next partition is overwritten. This can easily be fixed with KnifeST. You're right, you shouldn't have used CHKDSK3. If you remember how the drive was partitioned it should help to retreive the data. Don't worry the data is still there, unless CHKDSK walked all over the data which it shouldn't have.

Ian, try to mail Eric Northwood (studio3@cix.compulink.co.uk), he may be able to help. He has managed to perform a similar miracle on my C partition after the directory was wiped.

>you. I have no problem using such disks on either older version of TOS,
>or on MSDOS.

Likewise! But actually the "full" documentation of RECLAIM goes
on to explain that if you feed it a disk with absolutely NO data on it
e.g. a freshly-formatted disk - then it gives you the option to change
the No. of sectors per fat (FSIZE) and the number of Rootdirectory sectors
(ROOT). As you say FSIZE=5 is just too much for normal DD disks. Up to
850 Kbytes or more only 3 fatsectors will ever be needed.

Cheers,
W. Alan B. Evans

366. MPEG viewer in the making??

I'm going to visit the Netherlands next week and would appreciate if someone could tell me the cost of a Falcon there.

Is there a dealer with good prices in Amsterdam?

Thanks in advance,
Johan

From what I've heard, you can duplicate a CD for approx. 50US$, at least here
in Austria... (yes, there's even CD piracy now...)

Hm. Think it over: you save 2048 Bytes per disc, and you *might* get into trouble with newer versions of TOS or DOS in general. You have to process *every* disc you've got to save these 2048 Bytes per disc! The meaning: If do do this with 512 disc, you can save 1 Meg (maybe that's wrong, I'm not a computer).

And all these articles, the program and the replies are - hm, maybe 20 kb. You have to format about 10 discs to save the space we're wasting here.

Funny, isn't it?

BTW: What about HD- or ED-discs?

Source record: 204564

Hi!

This is one of the BlowUP030-Authors speaking. Yes, BlowUP030 is indeed working with VGA monitors. But you should know that the range of resolutions achievable with a VGA monitor is quite limited. The point is, that VGA-monitors can only handle a horizontal frequency of 31.5kHz (maybe a VERY LITTLE BIT more or less, one tenth (0.1) or so). Now the horizontal frequency the Falcon is producing depends on two things: The pixelclock the Falcon gets (internal or external) and the X-Resolution you choose. So with no external Hardware there is only ONE x-Resolution which will produce the necessary 31.5kHz horizontal frequency. With external hardware like BlowUP030 (the more expensive version) the external Pixelclock can be varied (nearly) freely, so that the horizontal frequency can always remain at 31.5kHz.

Generally I would recommend strongly to buy a MultiScan-Monitor with your Falcon. Of course that makes sense only if you buy a ScreenEnhancer like BlowUP. But the advantages are more:
- You have got a good monitor for future use. Think of Computers that may follow the Falcon and if not so, maybe you someday want to purchase a "real" graphics card for your Falcon030. With a MultiScan you will always be on the "safe" side.
- VGA monitors can easily be damaged if you send them too high frequencies. The Falcon itself cannot determine wether a MultiScan or a simple VGA-monitor is connected. So the user has to know that. And a MultiScan most probably (but not surely) won't be damaged if you give him too high or low frequencies for a short time.
- MultiScan monitors are not THAT expensive. Go into a PC-shop (risk it!) and look around.

Ask for a monitor that can stand horizontal frequencies from 30kHz to approx. 50kHz, that is what the Falcon030 usually produces with BlowUP. Vertical frequencies are not that critical, a good range would be 50 to 100Hz. In high resolutions like 1152x832x16col (which is the resolution I usually work with) a 14inch monitor may be even too small for some people. In fact you cannot see the fine rasters any more and moire effects can appear...! But generally 14inch should be fine, as resolution can be adjusted freely with BlowUP.

Questions and further information requests can be sent to

eberl@informatik.tu-muenchen.de

I'm selling all of my ST equipment for the price listed at the bottom of this message. I've grduated from school, and due to work I've had to get an MS-Dos notebook instead (for what it's worth, I prefer the ST - more intuitive and fun to use...sigh). I am only interested in selling everything as a package, primarily because I do not have the time to start splitting everything up. On the off chance that you want a specific item, my price is listed w/ each. I will only consider changing the price for someone who is interested in buying the whole package. Here goes:

*** Mega ST2 $600 (includes all upgrades listed)
- nice design, comfortable external keyboard, has room on the motherboard to easily be upgraded to 4 meg

- MIDI ports

- TWEETY board installed (splits the ST's sound output into 2 channels to be played through your stereo)

- SWITCHABLE TOS 1.2/2.06 (the newest TOS, I installed the switch myself; it allows you to have complete compatability with any software by choosing the operating system it's most compatible with. 2.06 is extremely fast and has TONS of features - nicer to use than macs or windows IMHO)

- all the usual ports- parallel, serial, hard drive, 2nd floppy, monitor, etc.

- golden image mouse

- extra atari mouse

- Warp 9 registered & installed

**20 meg hard drive $200

**SC1224 Color Monitor $200
- will accept either 60 or 50 Megahertz sinc

**SM124 Mono Monitor $125
- internally adjusted for maximum screen size

**2400 baud modem & software $50

**external DS/DD floppy $50

**Epson LQ-850 high speed 24 pin printer $200 (needs ribbon)

**Navarone Video Digitizer $40

**Monitor Master $40

**Mouse Master $30

**software: $600
|
- I have a ton of stuff, almost everything you could ever need/want
word processing, telecomm, dtp, programming, graphics, music, a *TON*
of games.

I have *** 335 *** disks of software. Plus an additional 40 or so
blanks.

All appropriate cables, power supplies, and manuals are
included. All of the equipment is in extremely good condition.
Everything is clean and has been VERY well kept.

- I also have some of the boxes for the hardware (computer & 1
monitor I think.

****
Total cost = $2,135
****
******
I will sell it all for $1,000 <---- (that's a good deal)
******

plus shipping (or will deliver within 1 hour driving time of Buffalo, NY)

If you are interested in what I've got, E-mail me at this account. I log
in daily..

As far as I know, this bug can happen in older GEMDOS versions too (when trying too hard to write to a full disk). Good hard disk drivers have a partition boundary check, so this will never wipe out the following partition (I guess that Atari will do the same for AHDI soon :-)

That depends heavily on what to put on the disc - it's the work behind that cost. DMI just announced their summer campaign prices: $500 to master a disc and $1 apiece for quantities of at least 1,000. This is for a two colour label, no packaging. So, $1,500 for 1, discs is not too bad is is?

I guess the $20K quoted is more in the way of Sega saying that it costs them between 1,5 and 2 mil. bucks to make a videogame. It all depends on the research/work involved. Dumping the archives onto a big HD and sending it off for mastering and production isn't exactly expansive...

>Now, if they had something like the Sherlock Holmes disc to produce,

>Simon Gornall

Whose's selling Falcons/HD with 4MB ram PLUS monitor for 950 quid,
I'd like to know? Doesn't sound too bad a deal at 950 for everything.
Mind you the memory expansion still bugs me. What's happenned to
all those companies that were going to sell cheap memory upgrades for
the Falcon, havn't seen one advert yet. What I'd like to do is
buy a bare Falcon, no memory no HD and build up myself as and when
I can afford it.

The prices I've seen are 950 without a monitor. OK maybe 1500 is a bit
steep but a fully load 486 is cheaper (including monitor) than 950 -
and no I don't want to buy a 486. Did any of you UK readers see horizon
(UK science program to everybody else) on TV last night, where
it was finally stated that Microsoft want to take over the world!
Now there's a good reason not to buy intel/microsoft crap.

Herb

If you mean mastering a CD-ROM from digital data, it's far less
expensive than you think. I believe that (in the US, at least) you can
get CD's pressed for about $1 a piece. There are places that will give
you around that rate for small runs, like 500 or a thousand.

For $20,000 you could buy your own mastering machine! (Though, not a
very fast one...)

Well, I've begun my coding for Mail Order Monsters. Now, all I have to do is get EA's permission to release it PD, w/o a lawsuit.....

For all of you who have never played Mail Order Monsters, it's a combat/kinda strategy game, where you control this maxed out genetic deviant and try and shoot/bash/bite/flame/poison/psi blast/etc another such deviant. The strategy comes in when you play tournament and have to care for your beast and make others, or improve it, while staying within a strict budget. It's sounds lame, (trust me, I know) but how many games from the C=64 do _you_ still play?

BTW, if this already exists, could somebody _please_ tell me, so I can mope and get on w/ my life...

>buying faster and more expensive hardware to run them on.. is that right?

Nope. My point actually WAS "start saving your pennies now, 'cuz a real cool game which requires GOOD hardware has been released".

One can hope that something like "The 7th Guest" would become available for the Falcon. I seriously doubt that developers are going to have the funds to do it, though -- what with the salaries for the actors, the musical score (although it DOES become a bit boring during the 'puzzles'!) and the need for extensive digitizing. Something like it *might* be done in the European market, I suppose, given the larger number of Falcons actually sold there.

Frankly, it would take a LOT in a Falcon-specific game to entice me to purchase one for game-playing alone.

Whoops - Seems like I'm a little out of touch (UK mags are so cr*p I
don't generally buy them), I think your estimate of 950 w/o monitor is
more like it than inc monitor. Still, you can get the vga monitor for
150, and you can get 50 off the price if you're nice enough. So you're
still talking 1050 or so, rather than 1500.

} The prices I've seen are 950 without a monitor. OK maybe 1500 is a bit
} steep but a fully load 486 is cheaper (including monitor) than 950 -

The cost of mastering/duplicating CD-ROMs has plummeted recently. You can purchase a CD mastering system (WORM ?) for as little as $3000 now which is good for creating and duplicating small runs of around 50 CDs. For larger runs, it's evidently still better to go to one of the companies who specialize in such things. This info was gleaned from an interesting article in a recent MacWorld about mastering your own CD-ROMs.

But... the "chicken and the egg" theory still applies to Atari users.

It should be fairly easy to port "The 7th Guest" to the Falcon, and if
game companies have the budget to produce such games for the PCs, they
surely won't mind the little additional effort to produce a Falcon
version - IF the Falcon turns out to be a platform to be taken
seriously...

If you're thinking about doing small runs, Pinnacle has a CD-ROM writer
priced at US$4,000 with discs rumoured to be available for as low as $6
apiece. The SRP is $15-20 I think. Now, you've got to have a PC or a Mac to
run the software though...

7th Guest....7th Guest...is that all people can bring up? It's not that great,
people, and I've (finally) beaten it. The graphics are amazing, and the
animation surpurb, but it's more an experience than a game. Hell, you could
probably port 7th guest directly to the Falcon, since they used some commercial
rendering package to render the damn thing, all you need is a translation mask.
(No, don't ask what the package is, I forget)

Sorry for sounding so pissed, but Jeez, it's not like it's the best game ever.
Now, starcon (which 'I' might consider proting), now that's a great game.

There are several good reasons why it has to use these resolutions, but
I won't bore you.

> Pity it doesn't auto-change to SThigh - that would be almost bearable.

Well if you tell me how to do that in a way that will work on any TT
or Falcon, I'll gladly add it. Since I have no access to either type of
machine (like most of the Atari world), I cannot experiment. If a simple
Setscreen call will work, with a check for the machine type, fine.
However, if that would be only "almost bearable", don't bother.

>are, where can I find them?

Download the German Zmodem program GSZRZ. The public version 1.9b does not
feature "Zmodem-in-a-window", but the version you'll get once you register
does. It can be installed as an Accessory for CoNnect OR, with MultiTOS, run in
plain multitasking as a _program_.

Works fine, I have it and use it regularly in the background.

bye, Peter

PS: registration costs are DM 30, and it's definitely worth it.

I have an older pamphlet by Seagate listing all their hard drives. If you can read the label on the unit, you can tell us about it. It usually starts with an STxxxx with the xxxx being the number of the unit. That will tell us about it and what we can do to help out.

Pinnacle Micro is selling a recordable CD-ROM for Mac and PCs that costs
$3,995. The ad says that you can produce data or audio CDs "within
minutes." For more information call 800-553-7070. I think I read
somewhere that they use a Sony mech.

You would definitely need special software to run this on an ST.

7th Guest is very cool. Game play, what game play? Just look at the
graphics. :-)

The graphics were created using Autodesk 3D Studio. They've got some
pretty cool renderings in there too. For example, they have a telescope
in one scene, and when you move closer to look through the eyepiece,
there's a great reflection on the brass. All in all, it's very well done.

>seriously...

Serious or not, it's NUMBERS that count to the big game companies. Unless the Falcon's installed user base _really_ becomes large, I would not hold my breath for very many ports of the more popular pc/amiga/mac games. It is most definitely _not_ a trivial matter to port the software, market it, and provide support for a game product. Even considering such "sunk" costs as packaging design and user manuals. porting software is a costly propsition.

Consider... suppose it costs ACME GAME CO. $20,000 to create "Road Kill Fever" (insert your favorite dream game title here) for a platform with an installed user base of 1,000,000. Statistics show that a successful product will sell to perhaps 1% of these users, meaning total sales of 10,000 units. A very successful game might sell upwards of 3% to 5%, meaning total sales of from 30,000 to 50,000 units (any more than that would be amazingly successful). At an optimistic $10 net profit per unit, that's $100,000 to $500,000 profit.

Now suppose ACME can port this program to another platform for only $5,000 (since the basic game design has already been laid out) but this platform has an installed user base of perhaps only 20,000. Using the same statistics, ACME could expect to sell only 200 to 500 units for this platform netting anywhere from $2,000 to $5,000 profit.

Now deduct development, operating, marketing, and overhead costs from each profit line. If you were president of ACME, what would YOU do? These statistics are just numbers that I seem to recall from some article I read and you can argue over them all you want, but the basic premise is clear.

>eoungh for covering the time and misc.

audio CD recorders start at about $7k or so. at $1500/CD above, the cost of the recorder could be amortized after less than 10 CDs. i was considering getting a CD-audio recorder for mastering vs DAT in the home studio i am trying to build (if i can ever get my hands on a Mackie 24*8).

are CD-audio recorders that much different than CD-ROM recorders? CD-audio holds ~75 min music (i'm told that figure was picked because Beethoven's 9th is about 74 min :-). assuming 16-bit at 44.1kHz (stereo), that works out to about 740 MB of data. what is the capacity of CD-ROM? i thought 5.25" optical disks were about 600 MB.

Try running HDFORMAT.PRG and go to 'Partition' - if the detail of your
partitions are correct then click on 'Write partition info'
it is possible something has wiped the info from the disk. I had a
similar thing happen to one partition and this got it back for me -
with all data intact.

: storage device? It's small, hold the same amount as a cd AND you can
: write to it. Hard drive of the future it looks like :)

A MD holds much less information than a CD (something like 85 percent
less than a CD). The reason why there's still room for 75 minutes of
music is that the music is "compressed". Sounds that the human ear
can't hear are removed, and also "weak" tones close to "strong" tones
are removed. I'm sure someone else can explain it better... :-)

But a writable 80MB medium with the MD-format sounds VERY attractive!

Try using the desktop.acc utility (from the floppy) to check and see if the
partitions are turned "on" (there will be a checkmark next to them, if I
remember correctly). This utility can be used to select various partitions
to be active. It is possible that yours are "deactivated".

That's the standard treatment from WalnutCreek CD-ROM production.
All their CD-ROM are either from Internet ftp site or user group (like C-User group CD-ROM are the recent C codes from C - User group).
If you have contributed to the program that was included in the CD-ROM, you can send him a note telling which one it's and where to find your name on it (so not everyone would pretent to have a program there).

Walnutcreek use silmilar CD-ROM manufature as posted eariler (the summer special offer from DMI). They take 8mm tape, DAT, 4mm tape, optical disk etc then make the master from there. So in principal one don't even need to have a ST to make the collection. A machine with Ethernet connection, big hard drive and one of those media drive, then just ftp over the atari.archive.umich.edu to it and/or add some others files, dump to the tape or what ever media that DMI can handal.

As far as I can see, the primary factor for Atari specific CD-ROM to appear is us -- the users. If there is a collective voice for buying such products, say 100 definitly would buy one for $25 to $40 range. Then some one might be willing to take the task and use DMI's special offer to make a run of 1000. With the 100 sold which would cover the cost, rest become profite then it would be more attrative to him then just grouch about chicken and egg, or ....

Just my 2 cents.

STalker III is probably your best bet, unless you're running MiNT.

STalker is a desk ACC terminal program with Zmodem and a zillion other
featuers.

If you had MiNT running, you could run rz in the background or a TOSWIN
window and you'd be laughing... Unless you tried something like compiling
C++ code with GNU C++...

I think that somehow the bug is worse on the Falcon. I have been using my
ST for ages with a hard disk and never even heard of this bug. I only got
my Falcon this year and the bug hit me 3 times already.

413. PMC Summer Tour (show announcement)

Newsgroup: comp.sys.atari.st
Date: 1993-06-09 04:30:35 UTC
From: darekm@microsoft.com
Message-ID: <1993Jun09.043035.14469@microsoft.com>
Source record: 204742

I'm posting this for someone else, so contact PMC if you have questions...

PURPLE MOUNTAIN ST SUMMER TOUR 5/27/93
==========

Purple Mountain Computers, Inc. will be sending a representative during the summer across North America including Canada, Mexico and the United States to promote Atari ST products.

PMC encourages user groups to contact Oscar Steele to setup a show. Demos will include Gemulator, the Freedom Floptical Drive, ICD's Link host adaptor, Stealth PMC 1.5 telecommunication program, CompuCycled books and software and two very special surprises (upcoming products).

CompuCycled software will be available for a 25 percent discount at the show or a 40 percent discount if ordered before the show (software will be brought to the show for users).

"This North American tour continues our tradition of trying to support and expand the Atari ST product line," said Oscar Steele, President of Purple Mountain Computers, Inc. "We've already begun establishing our local rep program and we're publishing a free newspaper for ST users. ST users don't need to sit on their butts - they have useful computers, and I'll be showing them that."

PMC is very ST pro-active and will be very happy to work directly with user groups to promote shows in unique ways. Vendors who are interested in attending shows are encouraged to contact PMC.

There's already one show scheduled in Tacoma, Washington. It is set for June 12, 1993 from 10:00 a.m. to 12:00 p.m. It will take place at the Fern Hill Library Branch located at 765 S. 84th St. (between Yakima and Park Ave's).

For instructions, a map or answers to any questions contact PMC. We will gladly mail out a flyer, which includes a map.

WESTERN WASHINGTON ST SHOW
==========

June 12, 1993 10:00 a.m. to 12:00 p.m. DON'T MISS IT!

DEMOS OF:
---
* Gemulator (Atari ST & 8-bit emulator for PC clones)
* Freedom Floptical Drive
* Freedom CD ROM Drive

* Syquest's new 105mb Removable Cartridge Hard Drive
* ICD's Link Host Adaptor

* much more!

AWESOME SALE:
---
* CompuCycled software at below wholesale prices

* 25% off already low prices
* 40% off for reserved programs (brought to you at the show)

* Buy/sell/trade your used software, bring a list with you!

* Bring a blank disk or $1 for list of over 3,000 computer
books as well as a PD/Shareware catalog.

DIRECTIONS:

Southbound I-5: take exit 129. At light make left onto Tacoma
Mall Blvd. Follow to So. 84th St. Make left and go
over freeway.

Northbound I-5: take exit 129. At end of exit make a left on Hosmer
St. then a right on So. 84th St.

Show Address : Fern Hill Library Branch, 765 S. 84th St., Tacoma

Source record: 204740
Cross-posted to: comp.sys.atari.st,misc.forsale.computers

I have the following items for sale:

$150 Seagate 80Meg SCSI 3.5" HH hard drive
perfect working condition
not sure about the exact model

$70 ICD AdSCSI interface card for Atari ST
add any SCSI device to an Atari ST computer

$15 power supply for above drive
not sure about total wattage, but powers drive
+ interface card

$210 for entire package. Also, will include external case (more of a
metal box. It currently doesn't hold the drive + interface card +
power supply, but it could be modified to do so).

e-mail if interested of for more details

Marinos, if you'd like to question the appropriatness of anything I've written, in E-Mail, I'd be glad to respond there...

If you'd rather question it for all to see, and waste bandwith in the process then that's OK with me too.

What you did was to pull several lines out of context and question their place in this newsgroup, without considering what they were in reply to.

I don't remember seeing you flame the original questioner, nor anyone else who posted about PC memory in the ST newsgroup.. did I miss them..?

BobR

>games written for those original machines ran twice as fast, or faster..

As an added comment here, the same thing happened to users of the
Apple IIGS when it was released. The Apple II used a 1MHz 6502 (The
Atari used a slightly faster 6502) and of course, everyone thought
that Apple IIs would be 1MHz forever. Then the Apple IIGS comes
along with a 65816 (As I believe, the same chip in a SuperNintendo)
and all of a sudded, games ran ALOT faster, that Apple even made
the system speed selectable to be able to play the older Apple II
games.

>means there might be 30 or 40 of them in the country by the following June.
>

Please, not another grouch...
I am cautious about the Jaguar release before Christmas, but I certainly hope that it will happen. This would be crucial to Atari if the system is be successful. It is especially imperative for the machine to be shipped in quantity for the Christmas selling season, which accounts for the most of some companies profits for the whole year, and we all know how much Atari needs profits.

That reminds me, I'll have to contact our buyer to see if he has ordered any Jaguars, I'd be the first in our store to buy one.
(I bought the first TurboGrafx AND the CD-ROM back in 1989 in our store, too)

To all you other grouches out there, now that the Falcon is hitting the store, are you going to buy one now, or start moaning about the Jaguar?

420. Amiga DSP - Complete Specs

Newsgroup: comp.sys.atari.st
Date: 1993-06-09 06:48:43 UTC
From: jorngh@dhhalden.no
Message-ID: <jorngh.1482.739608523@dhhalden.no>
Source record: 204743

ROGER ALLAN WAHLGREN wrote:

[Specs attached at end of post]

>Halonen you are so stupid !!!!!!!!

Good argument. I merely posted information. It's
not my fault that you can't stand the Amiga having
a better DSP.

>16MB of ram???? is it SRAM as on the Falcon ????
>The dsp in falcon can also access main memory which can be (as far) 128MB +
>14MB ......

Yeah, but it has to pull it via the 96 Kb cache,
it cannot access 16 Mb directly as the 3210. BIG
difference.

>Brainstorm in France has both JPEG and MPEG decompression on the Falcon ...

Oh, two hackers have coded this ? It's nothing
official like Commodore's and third party developer
support.

Here's some info on the AT&T 3210 DSP CHIP.... If anyone
has info on the newer 3207 chip, please post!

DSP3210 Overview

The DSP3210 is a full 32-bit floating point DSP implemented in .9 micron CMOS.
It provides many advantages over fixed point DSPs such as the Motorola 56000.
Some of the main features of the DSP3210 include:

* 32-bit floating point arithmetic.
* 32-bit addressing.
* Large (8k) on-chip, zero wait-state memory.
* Single cycle instructions (for up to 33 Mflops).
* Share bus with Motorola or Intel style CPU.
* Serial I/O with DMA transfer conters for up to 25 Mbits/second transfer:
Serial data transfers occur without processor intervention.
Cycles are stolen when necessary.
DMA control for serial in and serial out.
* Barrel Shifter for bit manipulation in graphics or data encryption.
* Both mu-law and A-law encoding.
* Bit I/O general purpose 8-bit I/O port for control of external hardware.
* Programmable 32-bit timer for interval timing, rate generation, event
counting or waveform generation.

* Fully vectored interrupt structure with hardware context save:
Allows very fast interrupt processing, up to 2 million/second.
* Low power CMOS design.

No special programming is required on the DSP3210 to implement floating point algorithms, or to process signals with a much larger dynamic range (in excess of 1500 dB as opposed to < 300 dB for fixed point). The DSP3210 is also designed to share a host memory bus with either a Motorola or Intel style CPU. This greatly reduces system cost by removing the requirement for expensive fast local memory for the DSP. This also removes any practical restrictions on program or data size. A large on-chip cache (8k) combined with software that intelligently utilizes the cache allows the DSP3210 to execute complex signal processing algorithms without expensive local memory. All instructions execute in a single cycle (four clock periods> 80 ns for a 50 MHz part or 60 ns for a 66 MHz part) and includes all floating point normalization (which is performed automatically). A single instruction may have two floating point operations: a floating point multiplication and a floating point addition. The DSP3210 also supports up to four memory accesses in a single instruction cycle (quad-word transfer). The DSP3210 architecture features seven functional units:

* Control Arithmetic Unit (CAU)
* Data Arithmetic Unit (DAU)
* On-chip memory (RAM0, RAM1, Boot ROM)
* Bus Interface
* Serial I/O (SIO)
* DMA Controller (DMAC)
* Timer/Status Control (TSC)

The Control Arithmetic Unit

The CAU is responsible for address calculation, branching control and all 16 and 32-bit integer logic and arithmetic operations. It is a RISC core consisting of a 32-bit Arithmetic Logic Unit (ALU), a 32-bit Program Counter (PC), 22 32-bit general purpose registers (r0-r22) and a 32-bit barrel shifter. This core executes instructions at up to 16.7 million instructions per second. There are special register considerations in the CAU:

r0 hardwired to 0 (always)
r1-r14 DA instruction memory reference (X,Y,Z) pointer registers
r15-r19 DA instruction memory reference (X,Y,Z) increment registers
r20 used by error exception facility to store old pc
r21 stack pointer (sp)
r22 pointer to the exception vector table (evtp)

The CAU provides the following branching and control instructions:

if (COND) goto {N,rB,rB+N} Conditional branch based on flags
if (rM-->=0) goto {N,rB,rB+N} Conditional branch using loop counter
goto {N,rB,rB+N,M,rB+M} Unconditional branch
nop No operation
call {N,rB,rB+N,M}(rM) Call subroutine

return {rM} Return from subroutine
do K,{L,rM} Do next K+1 instruction(s) L+1 or (rM+1)
times. K=0,1,2...127; L=rM=0,1,2...2047
dolock K,{L,rM} Signals interlocked bus transfer
doblock {L,rM} Signals quad-word transfers
ireturn Return from interrupt
sftrst Soft-reset; changes error level to base
level; encoded as spc=(byte)r0
waiti Wait for interrupt; encoded as spc=(long)r0

where: rB = pc, r0-r22
rM = r1-r22
N = 16-bit unsigned integer
M = 24-bit unsigned integer
COND = one of the DSP3210 condition codes (refer to DSP3210 manual)

The Data Arithmetic Unit

The DAU consists of a 32-bit floating point multiplier, a 40-bit floating point adder, four 40-bit floating point accumulators (a0-a3), a clip test register (ctr), and a control register (dauc). The multiplier and adder operate in parallel to perform up to 16.7 million computations per second (12.5 million for a 50 MHz part) of the form (a=b+c*d), also known as a multiply-accumulate. The DAU contains a four stage pipeline which is visible to the application programmer. The DAU supports the following floating point formats:

Single precision (32-bit) in both DSP32 and IEEE format
Extended single precision (40-bit) (uses 8 mantissa guard bits)

Single instruction data type conversions are done in the DAU hardware:

DSP32 and IEEE 32-bit floating point
16/32-bit integer
8-bit unsigned
mu-law and A-law

The DAU has a number of special instructions to greatly simplify data type conversions and other common operations:

[Z=] aN = ic(Y) Input conversion mu-law, A-law, 8-bit linear to float.
[Z=] aN = oc(Y) Output conversion float to mu-law, A-law, 8-bit linear.
[Z=] aN = float16(Y) 16-bit integer to float.
[Z=] aN = float32(Y) 32-bit integer to float.
[Z=] aN = int16(Y) Float to 16-bit integer (round or truncate, dauc[4]).
[Z=] aN = int32(Y) Float to 32-bit integer (round or truncate, dauc[4]).
[Z=] aN = round(Y) Round to nearest, float(40) to float(32).
[Z=] aN = ifalt(Y) Condidional assignment/memory write.
[Z=] aN = ifaeq(Y) Conditional assignment/memory write.
[Z=] aN = ifagt(Y) Conditional assignment/memory write.
[Z=] aN = dsp(Y) IEEE to DSP format conversion.
[Z=] aN = ieee(Y) DSP to IEEE format conversion.

[Z=] aN = seed(Y) 32-bit to 32-bit reciprocal seed.

Where [Z=] indicates that condition codes may be set. Note that Y may not be a0-a3 for the dsp() special function.

Addressing Modes

DSP3210 assembler language exhibits a syntax very similar to 'C'. The notation conventions are as follows: a0-a3 are the accumulators (DAU), and r0-r22 are the CAU registers. Instructions take the following appearance:

```
r2 = (long)r1 ; CAU register direct: store the contents of r1 in r2
r1 = (long)*r1 ; store value pointed to by r1 in r2
r1 = (long)r1 + 1 ; increment r1 by 1
*r2++ = (long)r1 ; postmodify increment r2 after storing r1 there (in *r2)
r3 = (long)r1 + r2 ; add two numbers in r1, r2: store result in r3
r3 = (long)*r1++r2 ; post modify increment r1 by r2: store the result in r3
a2 = a2 + *r2 * a3 ; use that pipeline!
```

The following table lists the various addressing modes supported by the DSP3210:

Instruction Type Addressing Mode	CA Data Move Group (CAU Reg)	CA Data Move Group (I/O Reg)	CA Arithmetic/ Logic Group	DA M/A & Special Func
Short Immediate			Yes	
24-bit Immediate			Yes	
Memory Indirect			Yes	
CAU Register Direct	Yes	Yes	Yes	
IO Register Direct			Yes	
DAU Register Direct			Yes	Yes
Register Indirect	Yes	Yes	Yes	
Register Indirect with Postmodification	Yes	Yes	Yes	

Latency Issues

The most difficult aspect of programming the DSP3210 is being aware of latency in the instruction pipeline. There are four cases in the DAU when the pipeline affects latency. The cases are:

1. DA Memory Writes. When a DA instruction specifies a write to memory, the value written is not available to be read from that location until four instructions later (a three instruction latency). For example:

```
*r3 = a0 = a0 ; instruction 1
*r3 = a3 = a3 ; instruction 2
```

```
. ; instruction 3
. ; instruction 4
a1 = *r3 ; instruction 5
```

The value read in instruction 5 is the value written in instruction 1, not instruction 2. Instructions 3 and 4 are latent instructions for instruction 1 and instructions 3, 4 and 5 are latent for instruction 2.

2. Accumulator as Multiplier Input. When an accumulator is used as an input to the multiplier, its value is established no sooner than three instructions prior to the multiply instruction (a two instruction latency). Note that this also applies to an accumulator using the X field of an instruction of the form:

```
[Z=] aN = [-]Y {+,-}X
```

For example:

```
a0 = a0 + *r1**r2 ; instruction 1
a0 = a0 + a1 ; instruction 2
. ; instruction 3
a2 = a0 * a0 ; instruction 4
a1 = a2 + a0 ; instruction 5
```

The value of a0 used in instruction 4 is calculated in instruction 1. The value of a0 used in instruction 5 is calculated in instruction 4 since there is no latency effect on accumulators used as inputs to the adder.

3. Branching. When a CA Control Group instruction of the form if()goto, call, return, goto is executed, the instruction immediately following is also executed before the branch occurs. This is commonly referred to as a delayed branch. The ireturn instruction is different, and execution of the base-level program resumes in the following instruction cycle. For example:

```
if(eq) goto over ; instruction 1
r1 = 3 ; instruction 2
. ; instruction 3
```

Instruction 2 is executed even if the condition is true and the branch is taken. If this is undesirable, a nop can be placed after the branch instruction, or if possible, the instructions can be rearranged. Because of this latency, a complex situation arises if successive branch instructions are coded in the following manner:

```
goto A ; instruction 1
goto B ; instruction 2

A:
.
B:
.
C:
.
```

The order of execution is instruction 1, instruction 2, A, B. If the instruction at A is not a goto, execution continues from B. If the instruction at A is goto C, the order of execution is instruction 1, instruction 2, A, B, C, and execution continues from C. Successive branch instructions are useful in some applicationss.

4. Conditional Branching on DAU Conditions. A DAU conditional branch or conditional arithmetic/logic instruction is established by the last DA instruction that affects DAU flags no sooner than four instructions prior to the test (a three instruction latency):

```
a0 = a0 + a1 ; instruction 1
a2 = a0 * a2 ; instruction 2
. ; instruction 3
. ; instruction 4
if(agt) goto next ; instruction 5
. ; instruction 6 (latent instruction)
```

The condition tested in instruction 5 is established by instruction 1, not instruction 2. Because of this latency effect, use the zero-latency ifalt(), ifagt() and ifaeq() functions where possible (see DA Special Instructions). The DA condition tested by these conditional accumulator loads is established by the last DA instruction that affected the DAU flags.

You do not understand the retail business where it realtes to game systems.

In the current market, game consoles are sold virtually at dealer cost. There typically is NO profit in selling either Nintendos, Segas, or the TTI Duo for that matter. (There is a little, but VERY little)

The profits come from selling the software, in some cases have a 30 to 40 point margin. Especially on the most popular titles.

$200 appears to be the magic entry price point, people will NOT spend more for a game system, typically. How Atari will manage that on a 64-bit RISC system is a secret to me. Digital has the Alpha 64-bit processor, and their systems are thousands of dollars more. (Too bad it won't run OS/2. Digital's loss)

I certainly hope that the Jaguar is successful, and Atari rises back to prominence... (Please, no snide kiddie remarks, eh?)

As far as I know the compression part was why it so long to develop. It is similar to JPEG compression in the sense that it is a lossy compression algorithm. The sound quality is said to be 13-14 bit as opposed to 16 bit on a standard CD. Note, that is subjective quality, the data itself is 16 bit. Since it only needs to read something like 1.5MB a minute I don't know how fast the mechanism is, but it could be the ideal backup medium. It could also be used for game software that uses samples and digitised images.

There's WINREC - a hrad disk recorde with DSP effects, shareware. There's also FRAC.CPX which draws fractals using the DSP.

427. Digital making ST computers

Newsgroup: comp.sys.atari.st
Date: 1993-06-09 08:46:02 UTC
From: mnj@sactoh0.sac.ca.us
Message-ID: <1993Jun9.084602.4047@sactoh0.sac.ca.us>
Source record: 204770

Recently I got a mail order catalog from Digital (you know, the VT-100, Rainbow, and Alpha guys) and I was surprised to see...

ST computers.

Actually, it is not what you think, they are marketing a line of IBM-compatibles with the ST moniker.

I thought that Atari had trademarked "ST" for themselves. Does anyone at Atari know about the use of ST by Digital? If not, who can I call at Atari to tell them?

The catalog call it, DECpc ST Deskside Family. They are tower-style systems with EISA architecture.

The models are:

433ST 486DX, 33MHz
452ST 486DX2, 50MHz
450ST 486DX, 50MHz
466ST 486DX2, 66MHz

Dos this mean that a 520ST is a Pentium, 20MHz machine?

Oh, and for the curious:
433 ST $2829
452ST $2879
450ST $3229
466ST $3279

Includes 4Mb, VGA monitor, and 245Mb hard disk.

428. Atari Portfolio replacement service

Newsgroup: comp.sys.atari.st
Date: 1993-06-09 08:52:47 UTC
From: mnj@sactoh0.sac.ca.us
Message-ID: <1993Jun9.085247.4169@sactoh0.sac.ca.us>
Source record: 204771
Cross-posted to: comp.sys.atari.st,comp.sys.handhelds

Since the screen display on my Portfolio has died (the rest of the system works) I inquired a few dealers on fixing it.

Since no dealers work on Portfolios, I called Atari, and was told to send the Portfolio to them, and it would not be fixed, but REPLACED with a new one.

They charge $110 for this service, quite reasonable considering the charge for fixing ANY computer, and the best part is that they give you a new one. New Portfolios cost $219.

So if anyone has a broken Portfolio and saving money for another, there is hope.

Send it to
Atari Corporation
390 Caribbean Drive
Sunnyvale, CA 94089

Now I should call about my dead SC1224 monitor.

>format floppies in this "RECLAIMed" state.

Well I did put that feature in my formatter (AFMT) once but removed it once I
realised the implications. If you increase the sector count on a floppy then
you are also effectively increasing the track count. So an 80 track disk
becomes an 81 track disk. We all know that disks with >80 tracks are a no-no
since their usage can trash some drives and not only that but the 81st track
of an 80 track disk is usually not formatted. Disk copiers won't like that.

I guess the procedure is fine for RAMdisks though.

> happens when you write to that disk on a PC!!

Right, the PC would think that it there are two more clusters on the
disk than are actually available, and would run into write errors.
Therefore, the approach used by RECLAIM is dangerous. Ancient
versions of my "Hyperformat" program did the same, but I soon
removed this feature. Instead, I once wrote a TSR that hooks
into Getbpb() and manipulates the disk's BPB *in memory*, so that GEMDOS
thinks the disk is bigger than it actually is. Thus, you don't
have to change anything on the disks (-> PC no compatibilty
problems). I wonder if this utility still exists somewhere on
my HD ... if somebody is interested in this TSR, drop me a line.

They are working on it. It cannot hold as much as a standard CD-ROM disc, though. I know the playing time is about the same, but we're dealing with compressed data here. The amount of data available on a MD will be 128MB, the same as today's 3,5" opticals. To me it's more like the floppy of tomorrow as the carts will be dirt cheap as soon as the audio side gets more widespread.

Isn't life just wonderful sometimes?

I know that there was talk of a falcon s/w modem and I see no reason why some enterprising person could not produce one.

For ftp s/w for the falcon a.a.u.e and its mirrors have a directory called Falcon which is full (well it has some) falcon s/w in. Its growing pretty fast and most of it is pretty good.

This may leave things a little open-ended for programmers, but to
make sure that a program will work as wished on a line of computers,
it may be a good idea (especially these days) to never assume
a maximum speed of the computer, maximum resolution, maximum number
of colors, etc. An individual program may dictate a maximum # of whatever
(say, it only *needs* 16 colors for a particular game, etc), but for
things that can be color-independent (like Gemview, that will handle
just about any screen mode/color palette, etc) it's probably a safe thing
to leave those options open.

Same goes for non-Atari computers (like the PC - it's always funny to
see a game set up to run under 8mhz played on a 33mhz system :-)

I think Atari (U.S.) intends on marketing a DSP modem in the future.
Bob Brodie sort of mentioned the idea in his latest GEnie RTC (get
the latest Znet for the full transcript). Dunno if there's any
currently available, however...

>Which other shareware- or pd-programms, special for the FALCON and it's DSP,are

Check atari.archive.umich.edu in the atari/Falcon directory (and its
various mirrors). I'd imagine some european sites are building such
a collection as well (if the Falcon gets real popular, they might
need to split atari/Falcon into atari/Falcon/Art, atari/Falcon/Telecomm, etc)...

That wouldn't be such a bad idea. Actually, such a group could
handle the PC emulators (Supercharger, PCditto(II), ATspeed, ATOnce),
MAC emulators (Spectre 128/GCR,etc), Xformer, etc. Once the Falcon
gets situated, the emulators for that could even be taked about
there (in addition to what I would imagine would be a comp.sys.atari.falcon
once the demand warrants)...

Michael Ziegler's GEM-SZRZ can do that, but you've to be registered to get the newer versions with windows. The public shareware-versions are in modal dialogs, so you can't do anything else.

But I would register, it's the best Zmodem I've ever seen and tested (and the fastest one). All the other XYZ, Stalker are not that good in my eyes.

Believe me...Roland

>Any tips?
>

Try Connect (conn196.zip), it is very good. DTerm is not that good but is very easy to use. Rufus is OK, but I don't know it that well so can't help. You would need a good zmodem protocol - you have a choice between XYZ.PRG or TTP as well as GSZRZ.PRG, both are shareware.

>

In the 2 still existing Atari magazines I don't see any advertisement from dealers in Amsterdam. That doesn't mean there aren't any. You could always call Atari Benelux in Niewegein. They gave me the address of one in Utrecht.

I have addresses of a few other dealers I would rather send you to like ATIN and Data Skip. If you want those then drop me an email.

What would you consider good prices. All dealers quote f 2699,- for a 4/65 model (those are Dutch guilders). They claim to have them on the shelve. One dealer will give you a f 150,- discount on anything else you buy an other will throw in an active speaker set, but they stich with the f 2699,-.

By the way $ 1.00 = f 1.82, don't know the Swedish crown here and now.

Ed

444. Diamond Edge patch 1.03/1.04 -> 1.10 to a.a.

Newsgroup: comp.sys.atari.st

>since their usage can trash some drives and not only that but the 81st track
>of an 80 track disk is usually not formatted. Disk copiers won't like that.
>
This is quite possibly a valid criticism (although all ST's I've used
can easily manage 82 tracks!). Nevertheless Neil's point is that some disk
copiers, when they read the bootsector and discover there are declared (say)
1644 sectors (10 sectors per track) would assume that 83 rather than 82
tracks would be needed. However this is _NOT_ the case with the diskcopier
I (and many others) use namely DCFORMAT (form Double Click Software). The
fact that the last 2 clusters are MARKED_BAD ensures that in the "Disk Copy"
option of DCFORMAT at least, only 82 tracks will be formatted and written
i.e. you get an exact copy of the RECLAIMed disk.

So the message is (if you use RECLAIM) to check whether your
favourite diskcopier as as "intelligent" as DCFORMAT and, if not, change
to DCFORMAT. Sorry, I don't have an encyclopaedic knowledge of disk-copiers
so cannot comment further.

Cheers,
W. Alan B. Evans

With everyone chatting about the falcon, I thought I would post my impressions of it. My friends music store, Toad Music (Yes.. very much related to Toad Computers..) has a falcon now, and has some of the music software installed.

The Gem looks nice, but still doesn't look as slick as other interfaces. It is a nice step in the right direction though.. and the colorful icons are really nice. The music software however was not all that impressive. It sounded find, but was fairly slow and sort of flaky. (Ie: some audio was recorded to disk, but it woult play back. [This could very well have been his fault though.. ;)]) The music (that did play) sounded great though..

I think the machine's hardware is very good.. and at this point it will be up to the people to make good, solid, professional software for it. The 4 Track editor looked ok, but in 256 color mode, the colors were awfully ugly.. not very professional looking. And as we all know, looks count for an awful lot.

I'm hoping to pick up a few of the falcon demos floating around though, and really impress peoplee going to the store though.. ;)

Source record: 204786

I have STalker 3.02 and use it as an ACC (4MB 1040STe) and when I do Zmodem txfers, I can't even move the window without halting the flow! When I close the ACC, the lights on the modem (indicatin RD/SD) go off--doesn't sound like "Background Transfers" to me... perhaps 3.02 is an older version.
What is wierd is that I can close the ACC window and still have regular data (RD) coming in. Perhaps this is the background transfering I hear about 8-) .
Overall though, STalker is one of the best terminal programs I have used (I tried FDZT, Flash, etc.) and for what I need/do it is fine.

BTW: the modem I use (for txfers, etc. above) is a Supra FAX/Modem (the V.32bis/V.42bis) 14400... piece of $hit if you ask me (less than 2 months after purchasing it new, the speaker died! -- I called supra and their database had crashed/changed/whatever, and they did not have my reg. card --how convenient!).

From: rosenkra@convex.com
Message-ID: <1993Jun9.154728.9449@convex.com>
Source record: 204776

i have uploaded mdl10.zoo to a.a. mdl (version 1.0) is a program to view
view DL animation files (.dl) on a monochrome ST. this is a 1 day hack
and uses the Setscreen flicker trick to make images appear to be grayscale.
the zoo file contains executable (.ttp), source code, and a test .dl
file (along with a program that creates the .dl file). if you can run
MGIF on your system, this should work ok. if not, have at the sources
to "fix" it. i have only tested it with a very few version 2 (medium
format) DL files and it works ok.

if i have time in the next couple of weeks, i'll also make a simple grasp
viewer (for .gl files), again for monochrome (only).

enjoy...

Well, CD-ROMs have a lot more error detection/correction bits than
audio CDs (consider how many 'bits' of music you hear are just
interpolated (aka guessed) by the CD player-these would become hard
errors in a CD-ROM!). Thus the reduction to ~600Mb per CD-ROM.

There's also such things as directory structures (etc) that audio CDs
don't really have and CD-ROMs do have.

Not really. It was mentioned in the german magazine "ST Computer" after the CeBit, and in ST Computer 6/93 the company "FCS" advertised it - I think it's called "<something> Sonic" (like Mighty Sonic, their TT Fast-RAM board), and it's supposed to cost only 400DM. Personally, I don't think it's being sold yet, but perhaps someone on the Net has bought it...

456. Need SM124 wiring help!

Newsgroup: comp.sys.atari.st
Date: 1993-06-09 19:13:14 UTC
From: lancer@wpi.WPI.EDU
Message-ID: <LANCER.93Jun9191314@wpi.WPI.EDU>
Source record: 204790

My ST came with both the SM124 and SM1224 monitors. Unfortuinately, the previous owner had decided to try to get the SM1224 to work as a VGA monitor and in the process has destroyed the Atari connector on the end of the cable. So I have one connector and two monitors...

I have the pinouts as presented by Atari in the manual, but I don't know which wire goes to which pin. Can someone help me out? I'd really like to get at least the SM124 working... It's got a yellow wire, a red wire, a green wire, a "clear" wire surrounded by copper insulation, and this all is surrounded in a weave of silver wire. According to my manual, the pinouts for Monochrome are:

1 - audio out (does this go to the speaker in the monitor?)
2 - composite video (is this any use?)
3 - general purpose out (what's this?)
4 - mono detect (this gets grounded I guess)
5 - audio in (does this go to some sort of A/D?)
6 - green
7 - red
8 - plus 12 volts
9 - h sync (I think this is the green wire on the SM124)
10 - blue
11 - monochrome
12 - v sync (I think this is the red wire on the SM124)
13 - ground (this goes to the shield, right?)

So why can't I get my monitor to work? It flickers like it's either getting no sync or like the vertical and horizontal hold are way off. The same happens for the SM1224.

Does anyone know more about the wires in those monitor cables?

Thanks a lot!

.s.

This newsgroup has been just great... Thanks to everyone who responded about my earlier questions. I'll write to you all as soon as I can!

```
PURPLE MOUNTAIN ST SUMMER TOUR 5/27/93
======================================================================

Purple Mountain Computers, Inc. will be sending a representative
during the summer across North America including Canada, Mexico and
the United States to promote Atari ST products.

PMC encourages user groups to contact Oscar Steele to setup a
show. Demos will include Gemulator, the Freedom Floptical Drive,
ICD's Link host adaptor, Stealth PMC 1.5 telecommunication program,
CompuCycled books and software and two very special surprises
(upcoming products).

CompuCycled software will be available for a 25 percent discount
at the show or a 40 percent discount if ordered before the show
(software will be brought to the show for users).

"This North American tour continues our tradition of trying to
support and expand the Atari ST product line," said Oscar Steele,
President of Purple Mountain Computers, Inc. "We've already begun
establishing our local rep program and we're publishing a free
newspaper for ST users. ST users don't need to sit on their butts -
they have useful computers, and I'll be showing them that."

PMC is very ST pro-active and will be very happy to work directly
with user groups to promote shows in unique ways. Vendors who are
interested in attending shows are encouraged to contact PMC.

There's already one show scheduled in Tacoma, Washington. It is
set for June 12, 1993 from 10:00 a.m. to 12:00 p.m. It will take
place at the Fern Hill Library Branch located at 765 S. 84th St.
(between Yakima and Park Ave's).

For instructions, a map or answers to any questions contact PMC.
We will gladly mail out a flyer, which includes a map.

CONTACT:

I don't know who you spoke to at Atari, but officially it appears
that Atari 'likes' minixfs but don't want to currently ship any non GEMDOS
filesystems with MultiTOS. I'm too biased to give an opinion of this.
So that is currently 'it' as far as Atari is concerned. Offers from
other interested parties welcomed.
Steve.

461. Atari stock up, up, up

Newsgroup: comp.sys.atari.st
Date: 1993-06-09 19:33:01 UTC
From: L676791@LMSC5.IS.LMSC.LOCKHEED.COM
Message-ID: <93160.45181.L676791@LMSC5.IS.LMSC.LOCKHEED.COM>
Source record: 204787

That thumping noise you're hearing is the sound of me kicking myself for not buying a s--tload of Atari stock when it was under a dollar a few weeks ago. In fact it was trading for 15/16 (or less) in April or May, and yesterday it closed up on the AMEX at 2-9/16. That's close to triple its value from just a few weeks ago. Obviously, this is not a blue chip stock, but something is going on to convince people to buy Atari. The question is - how high will it go? Has the elevator reached the top, or are we still on the bottom floor? We missed the last train. Is there another one leaving the station soon? :-)

It's not that much anymore. Recently I've seen ads for writable CD-ROM
mastering stations for Macs for a few thousand $. It is now feasible for
a *very* small company (or rich individual!) to make their own CD's.

Message-ID: <1993Jun10.014934.1834@mnemosyne.cs.du.edu>
Source record: 204793

I've finally tracked down an elusive bug in minixfs 0.60 . I could never
reproduce it myself until recently.
Basically if you have a V2 filesystem and a directory bigger than
7K it will bomb when accessing/reading the directory. A fixed version of
the binaries is/will be on atari.archive and ftp.uni-muenster.de as
mfs602b1.zoo.
If you are recompiling the pl4 sources then change the single
occurence of NULL in minixfs/zone.c to &dummy .
Keep bug reports coming, they are most helpful ...
Steve.

Ian> or on MSDOS.

I agree with Ian! I often formatted my disks on my Sun SPARC at work,
and on occasion filled it all the *way* up. On my ST I was still able
to read the files. After all, it just follows the FAT pointers. I
suppose that the problem would be a file that starts in these last 2
clusters!

469. ESS UUCODER 4.0 (MultiTOS Compatible) (a.a & c.b.a.st)

Newsgroup: comp.sys.atari.st
Date: 1993-06-10 08:19:04 UTC
From: mforget@elfhaven.ersys.edmonton.ab.ca
Message-ID: <H.eg.ZMdaDhRFCi_@elfhaven.ersys.edmonton.ab.ca>
Source record: 204582

Hi!

I have sent ESS UUEncode/UUDecode (one program) to atari.archive and comp.binaries.atari.st just a few moments ago. It should appear on atari.archive under the name uucode40.zoo (or UUCODE40.ZOO).

Here is a bried summary of the new features, followed by a general description of the program.

ESS UUEncode/UUDecode 4.0 is a significant improvement over the previous version. It is now MultiTOS compatible, and it uses non-modal window dialogs (so you can use accessories even while inside a dialog box). This version has a configuration file (loaded at the start of the program), and also allows you to load and save additional configuration files from within the program. Lastly, it allows you to choose the target file name and path name manually.

ABOUT ESS UUEncode/UUDecode:

*) A *GEM Program* (menus, dialogs, mouse) that can both encode and decode files (one program does it all). The user can set the size of the file segments (if any) and whether or not the full path of the file being encoded will be stored in the encoded file, or just the filename. While encoding or decoding, the user is shown an _informative_ progress display, featuring a percentage indicator, the name and path of the current file being processed, and the name and the path of the target/source file. For users who like to install programs on the desktop as icons, this program is equiped to handle an unlimited number of files (like a batch). It will automatically decide whether it should encode the file or decode it. The program is faster than any other encoder/decoder I have seen, and has support for the ARGV, xArg, and old-standard command line formats. The dialog boxes are all moveable (click on the window mover bar) and the screen is redrawn very quickly. This program is ideal for floppy disk users and hard disk users alike.

Enjoy!

: >Oh, goody: Atari has another machine to release "close to Christmas." Which
: >means there might be 30 or 40 of them in the country by the following June.
: >

: Please, not another grouch...
: I am cautious about the Jaguar release before Christmas, but I
: certainly hope that it will happen. This would be crucial to Atari
: if the system is be successful. It is especially imperative for the
: machine to be shipped in quantity for the Christmas selling season,
: which accounts for the most of some companies profits for the whole
: year, and we all know how much Atari needs profits.

I find it unlikely that there will be any units by Christmas
given that they didn't even have a prototype ready to show
anyone last week.

Besides, a 64-bit RISC machine for $200? Hehe, who are they
trying to kid? You cannot design and fabricate your own
64-bit RISC mpu's for that, much less an entire device.
Barring any recent wrinkles in the laws of physics or economics,
I'd say that this is more smoke and mirrors from Sunnyvale.
Remember how long it took them to release their other products
and then remember how many products simply never arrived.
I think this was just an inexpensive ploy to take the wind
out of 3DO's sails.

: To all you other grouches out there, now that the Falcon is hitting
: the store, are you going to buy one now, or start moaning about the
: Jaguar?

I find it interesting that you are relegated to talking about
mythical GAME machines when it comes to Atari. If they DO
come out with some sort of game console, you can bet that
the pc's made by Atari will suffer. They simply don't have
the capital to stay active in both markets. A successful
game console would ironicly probably kill off any future
for your beloved GEMbox.

Cheers,

Chris

This was on the German program Computerclub. Apparently some German
hackers have made some adaptor thingy to use the minidiscs. The
software to use the minidiscs is not that good yet.
But can a minidisc contain the same amount of data as a CD?? I can't
believe that. Minidisc needs extensive compressing for one hour of
music while a cd gets it all uncompressed.

No, the MD is not very well suited for storing computer data, except with good recovery strategies. The problem with Minidisc is that it has good quality sound when doing playback, but has major troubles doing decent recording. Minidisc has 10 seconds of RAM to straighten out troubles when reading (vibrations and so), but this does not work when recording, so just a small vibration could ruin what you were writing. Someone correct me if I am wrong. I am obviously biased since I live in the Netherlands where Philips (or Phillips for Americans) makes the DCC ;-)

If you do not need fancy terminal emulation, but just a dialer,
download/upload protocols and easy capturing take a look aat Dterm. I
use it all the time when connecting to Michtron BBS'es.
Other BBS'es are difficult since most use the ANSI protocol for which
you need COnnect, Ansiterm or something similar.

From: malmlund@kruuna.Helsinki.FI
Message-ID: <1v7oig$en6@kruuna.Helsinki.FI>
Source record: 204611

A friend of mine is in DESPERATE need for the installation program for old LACOM hard disks. His problem:

I have an old 65 MB Lacom hard disk and it should be formatted. Yet, it doesn't seem to be possible to do this with Atari's HDX. There is supposedly some program called MDDRIVE.PRG which came with new Lacom hard disks (I bought the disk used and didn't get the program).

So, if you have a Lacom hard disk (not SCSI) and the programs, please send e-mail. Or if you know some FTP site which could have the program(s), please tell me. I can't use the hard disk before formatting because it has become messed somehow (I can't boot it).

The address and telephone number of LACOM would also help.

(BTW, Lacom is a German company.)

Send your answers to the email address: malmlund@kruuna.helsinki.fi

Greetings,
Jouni

483. Which MultiTos is being sold?

From: minidis@urz.unibas.ch
Message-ID: <1993Jun10.165417.42972@urz.unibas.ch>
Source record: 204610

Hi,
(mostly) everyone knows that the official Atari MultiTos is now availble.
From a german company there exists a software product which is also called
MultiTos which exists now approx for already one year.
So when I read a software-add in a magazin, which program are they selling?
With the Atari MTos there is no reason to buy the other MTos (theoretically)
(I am speaking of non-Falcon users), does that automatically mean that they
are selling the Atari MTos?

Ask the company that is selling the software? Probably. Or does anyone
know anything more specific about this?

>
[Clever .sig Removed]

Warner's has effectively abandoned the Atari line, although they still have a small assortment of used software and hardware available for sale. There always seems to be some controversy about their marketing methods and customer relations within the Atari community, consequently I never patronize their store.

Computer Plus in nearby Chula Vista has been actively supporting the ST series no matter _how_ bad the marketplace was. True, they also sell MS-DOS clones (gotta keep that cash flow up), but there always seems to be a large display of fresh software (sometimes imported from the UK), and service is always available. Contact: Mark Lawless, (619) 691-7844 Tuesday through Saturday. Location: 642 3rd Avenue (upstairs). Or call the store BBS at (619) 691-7862. I usually wander by several times a month just to see what's going on and pick up copies of ST Format / ST User / ST Action.

```
REFLEX 1024 Graphic Card for sale
=================================

* monochrome
* for MEGA STs only (MEGA Bus connector)
* TTL and analog output
* up to 1024 x 1024 at 70 Hz, non-interlaced (!)
* directly connectable to SM-124 or compatible monitors
* resolutions on an SM-124 e.g.: 768 x 496, 1024 x 480, 1024 x 960 (interlaced), 70 Hz
* connectable to almost any monitor with optional cables.
* including software (driver and utilities)

Price: 250,- DM
```

486. Stock is skyrocketing!

Newsgroup: comp.sys.atari.st
Date: 1993-06-10 18:01:21 UTC
From: cyclone@netcom.com
Message-ID: <cycloneC8F3E9.1vt@netcom.com>

Atari stock is simply skyrocketing - up over 500% in little more than a month. From a low of 1/2 it's now at 2 13/16 and has been among the most heavily traded AMEX stocks. It has almost surpassed Commodore (3 1/8), though I have no idea which company has more outstanding shares of stock.

Why didn't I take a risk and buy at 1/2? Arrgh!

Bill

487. Jaguar based computer?

Newsgroup: comp.sys.atari.st
Date: 1993-06-10 18:02:11 UTC
From: et@pita.cs.huji.ac.il
Message-ID: <1v7sv3$jtl@bagel.cs.huji.ac.il>
Source record: 204621

I just looked into the group, and read something about a Jaguar games machine with 3D graphics hardware.
I'm interested in graphics apps, but I don't have the cash for an SGI machine, and a cheap computer based around the Jaguar hardware seems like a perfect solution.
Anyone has any idea if such a beast will exist, and if so, when?
I think that such a machine is the only thing which will prevent me from buying an Amiga when Commodore releases the new chipsets.

Please e-mail me a reply. I don't usually read this group.

ET

P.S. Like WOW! 3D shaded polygons in hardware on a $200 machine - I'm really impressed.

> From a german company there exists a software product which is also called
> MultiTos which exists now approx for already one year.
> So when I read a software-add in a magazin, which program are they selling?
> With the Atari MTos there is no reason to buy the other MTos (theoretically)
> (I am speaking of non-Falcon users), does that automatically mean that they
> are selling the Atari MTos?

> Ask the company that is selling the software? Probably. Or does anyone
> know anything more specific about this?

I've never heard of this other MultiTOS? Maybe you're thinking of MultiGEM (which, by the way, is not worth buying... most of the programs I use don't like it, and the version of NeoDesk I had when I bought it didn't work with it, so I haven't used it since.)

This .sig is $hareware. If you use it for more than a month, send me all of your money, then see a psychologist. Or kill me.

>clusters!
>
Almost! (Your last sentence is not quite true).

Although I almost never use a PC, I've looked into this business of compatibility between the PC format and the ST. I found that the TOS "bug" merely prevents WRITES to the last two clusters - the ST will quite happily READ them and (Dr. Sobek!) it _is_ quite happy to read a small file of <= 2 clusters that may exist there - indeed it will even DELETE it, but if you do that you will NOT be able to _write_ anything in its place (without using RECLAIM or similar trick to kid TOS there are more clusters on the disk). I should add I did these tests using an IBM formatted disk on a TOS 1.2 machine.

As far as my tests show, RECLAIMed disks are fully compatible with the PC format in the sense that you can both READ and WRITE a disk full on either machine. Some comments made on this Newsgroup seem to ignore the fact that the non-existent declared clusters on a RECLAIMED disk are MARKED_BAD and so, even on a PC, no attempt will be made to overwrite them.

As far as I can see, Claud Brod's utility that does not alter the floppy but alters the total Clusters No. held in memory in the Bios Parameter Block for drive A:\ achieves exactly the same thing as RECLAIM. However it needs to be memory-resident if it is to do this automatically and thereby deprives your machine of some RAM. It also needs to worry about what you put in drive B:\ if you have one. It does, however, safeguard against using utilities (like DISK_TOOL (DT.TTP) with option "-w" that will wipe off ALL the fats including MARK_BAD marks (0xFF7)). If such a RECLAIMed disk that

subsequently had its FATS wiped were used on the PC then there could be trouble if you attempt to fill the disk. The documentation I included with RECLAIM warns against these things.

W. Alan B. Evans.

Frankly, I'm baffled. Atari's balance sheet is a shambles, they
have very little capital compared to their peers and they are
in debt up to their eyeballs. My guess is that it has something
to do with that ridiculous comment about putting out a 64-bit
game machine for $200 by Xmas. P.T. Barnum would love the Tramiels.

BTW, the stock peaked at 3 and closed today at 2 7/16 (off 1/8) on
fairly heavy (for Atari) volume.

Cheers,

Chris

I would highly doubt it. Although Atari evidently spent quite a bit making an impressive chipset for the Jaguar, things like that rarely migrate back to the computers... The primary obstacle is that they have a lot invested in current line (including a (relatively) BRAND NEW one), and setting up a real OS, apps, and support for a new line would be a big stress on a struggling company.

Of course, there are always people (myself included) who would live without the support and software to get some really neat hardware cheap, but that segment is not large enough to support even a bare-bones offering (observe the great amount of public complaints that Atari gets for there support already...).

I also don't know if the Jaguar chipset would be good for a general purpose machine, since (presumably) it's highly tuned for game graphics (read: it probably cheats a lot).

>P.S. Like WOW! 3D shaded polygons in hardware on a $200 machine -
> I'm really impressed.

Don't be too surprised about the price. After all, this machine cannot be used as a general purpose computer (lacking any reasonable I/O except graphics and sound), it requires relatively little support, and it's price is made to sell _cartridges_.

If - I say if - ATARI should really be able to sell the Jaguar this year (something the I can hardly believe) then the stock will go up more. But as long as ATARI can't show the machine to the public they surely can't sell it...

The market for video games is big - not everybody wants to buy a 486 for good games. And the market for the Falcon is there - too. Even more for the next Falcon.

It could be "the bigger fool" phenomena. On a slight upturn, people will buy into a stock on the assumption that there is a bigger fool than them who will buy the stock at yet a higher price. Eventually there are no more bigger fools, and then the stock price comes a tumbling down.

Actually, it seems that we have to make fun of *everyone*, regardless of
whether or not they know an answer, have something meaningful to say, etc...
>
>Let's not explain anything, or try to help anyone understand the way
>things work.. let's just call their questions "quesswork mumbo-jumbo
>made up trash"...
>
>What do you think this newsgroup is for, anyway..? Helping people...?
>Answering questions..? Get real... this is the ATARI newsgroup..

Judging from your posting, I guess this group is mainly for *asking* questions.
With a heavy dose of snappy comebacks, of course, especially for rhetorical
and sarcastic questions...

You know things are bad when the discussion in a group is about the discussion
in the group, as opposed to the topic the group was originally chartered to
discuss, eh?

But anyway... I guess it's too easy for those of us who've been participating
in this newsgroup for so long to dismiss "naive" questions or answer them out
of hand with biting retorts. We've probably rehashed things a zillion times
and this time is nothing different from the last, etc. (Does that mean that
there isn't anything new or interesting to discuss about Atari systems any
more? Hm...) We're only human, there are limits to patience, (there's a loaded
statement...) so it goes.

This is probably going to come out as extremely rude, but I feel the need to
mention it anyway... I'm somewhat puzzled by the level of questions Len has
been posing to this group. Coming from a forum (Cleveland Free-Net) which he
was billing as the premier Atari forum in the electronic world, I would have
expected him to know these answers already. The TT has been around long enough,
I'd figure that most people who knew that two kinds of RAM existed on that
system would also already know what the distinctions were... Obviously I
figured wrong, but it's still surprising to me.

>errors in a CD-ROM!). Thus the reduction to ~600Mb per CD-ROM.

yes, of course. error correction. is this hardware or software though? i would guess software (8+1 parity, for example, which would take the audio ~720MB down to ~600MB with FAT-like structures). i would think you could write a driver to talk to a digital interface on an audio CD recorder (say AES/EBU or S/PDIF). the appropriate standard would be the main issue. for example, you can implement RAID 5 on disk drives without changing the drives themselves or their controller hardware.

>There's also such things as directory structures (etc) that audio CDs
>don't really have and CD-ROMs do have.

this is definitely just a software (driver) issue. and i believe audio CDs do have a table of contents, analogous to a directory...

I dunno - I use MultiGEM sometimes - it seems to like GEM-based applications
the best (like say WordwriterST, Gemview, etc). It does work with the
Gemini desktop *if* you set Gemini as a "booted" program (i.e. if you
boot up with MultiGEM like normal, THEN load in Gemini, it's not quite
right) - could be a related thing to Neodesk as well?

I just like being able to switch between things as easily as say under
Windows or Multifinder (I just wish they allowed you to change
task priority settings so zmodem wouldn't take up so much CPU time :-(

I wonder what would happen if you booted with *both* MTOS and MGEM :-)

>Hey, that sounds great. Something is happening! Is ATARi doing some
>marketing or what? Or are there some interesting insider things going on
>about the Falcon and the Jaguar?

It's probably a combination of the fact that the Falcons are finally
starting to reach the public, and the press release on the Jaguar,
plus who knows what else.

Maybe someone could answer me 2 simple stock questions (no, I'm
not asking for advice - just info :-)

1) who or what cause the price of the stock to change?
2) does Atari send a newsletter/brochure/etc to its stock holders?

We might just get caught up in a GOOD catch-22:
-Atari releases products and stock goes up
-stock goes up, influencing people to make products for the Atari

Of course, it can always change, but it's looking on the up side for
the time being :-)

From what I've read, the Minidisc uses a lossy compression to store its
data... this means its not suitable for data storage, unless the
compression in the hardware can be turned off.

>stress on a struggling company.

While I also doubt that a computer will emerge from the Jaguar chipset, isn't it at least a bit intriguing what this small, struggling, "will be dead in a few hours" company is doing?

First, they have the Falcon which is shipping. Sure, it's in small numbers, but it always starts out that way. This is their main concentration at this time. Home/multimedia/music computer with DSP and SCSI-II for under $1500 with 4megs of RAM and an 84meg hard drive built-in. That's a deal if I ever saw one.

TTs and MegaSTEs are in production again.

They have the Lynx which is doing well. Indications from the outside show that it's not blowing the others out of the water in terms of market share, but it sells well.

The Jaguar should be out in a year. Without a doubt, it's been in development for a good amount of time.

MultiTOS, a sophisticated, pre-emptive multitasking OS, for the ST/TT computers is shipping.

SpeedoGDOS, an excellent outline font extension, for the ST/TT computers is shipping.

AtariWorks, an integrated word processor, database, spreadsheet program, for the ST/TT computers is shipping within the month, if not now.

They licensed that Cinepak video compression technology, so something must be cookin' in the oven.

While they might or might not be struggling, they definitely are small, and they definitely are working hard. Just like little elves. :-)

514. Magic Sac Plus Nightmare

Newsgroup: comp.sys.atari.st
Date: 1993-06-11 05:09:00 UTC
From: automan@stein.u.washington.edu
Message-ID: <1v941cINN3gb@news.u.washington.edu>
Source record: 204642

Greetings!

I aquired a 1987 Magic Sac Plus and a a Set of Apple II Roms for free. Problem is, when I put the two together, they don't work. I am sure the ROMS are fine, and the Magic Sac had never been used till I tried it, but I think I know what the problem is.

The manual (also dated 1987) states that the Apple ROMS must be 1983 to work, and mine are from 1984, guess these are some kind of 128k ROMs that do not work with Magic Sac.

My question is, is there new software out there to let these ROMs work with Magic Sac Plus? I can't seem to locate an address for Dave Small, or I would just ask him directly.

In the event that I can't get these ROMs to work, I would be in the market for aset of ROM chips that would work. I check on used busted up MAC stuff today and found a FUNCTIONING MACII for $380, which would be my last alternative.

But before I do anything rash, I wanted to see if the Atari Braintrust out there could provide any useful suggestions, ideas, sales pitches, etc.

Your assistance would be greatly appreciated!

Thanks in advance!

515. syquest cart on ST, Mac, and PC

Newsgroup: comp.sys.atari.st
Date: 1993-06-11 05:14:34 UTC
From: ggreenbe@rodan.acs.syr.EDU
Message-ID: <1993Jun11.011434.23055@newstand.syr.edu>
Source record: 204650

I would like to have msdos formatted syquest carts availble for ST, Mac, and PCs. An ICD-ST format, and even an msdos format provided by ATSpeed, are not readable by the Multi-Driver init from Insignia Solutions, which is made to allow Macs to read carts. A format done on a real PC via a scsi card can be read by Macs using Multi-Driver. Unfortunately, such carts are not readable on an ST! (I'm using v 5.x of ICD's software.) Actually, I'm not sure that they are not readable, but they cannot be written to. Regardless of whether I partition the cart into 2 or leave it in 1 partition, the ST tells me that there is no room left on the cart when I try to copy files to it (even if it is the first file to be copied!). Of course, if I use the ICD software to repartition the cart, the Mac can no longer read it.

Do you get the picture? The ICD software will not properly recognize the PC-formatted cart, and the ICD-formatted cart will not be read by the Mac! Is there any way to solve this problem?...perhaps via newer ICD software?

Any help will be greatly appreciated.

516. Atari ST Spring Cleaning

Newsgroup: comp.sys.atari.st
Date: 1993-06-11 05:31:21 UTC
From: andy@jarthur.claremont.edu
Message-ID: <C8FzCA.DBs@news.claremont.edu>
Source record: 204643

It's spring cleaning time; time to clean out some of the stuff I
haven't used in a while. I have the following Atari ST stuff for
sale:

Hardware:
Atari 1040 ST, with SS internal drive and 520 STfm faceplate. Missing
shifter chip. Nonfunctional after shipment, but should be easy to fix.
GTS-100 DS/DD external drive
Z-Keys external keyboard interface, with driver
Keyboard springs
Standard Atari joysticks
2 Atari mice with flaky cords

Development:
Laser C
Personal Pascal
GFA Basic 3.0, with compiler
GFA Companion
AssemPro
A-Seka
Tempus II

Development documentation:
Tackle Box ST
Compute!'s Technical Reference Guide, Volume One: VDI
Compute!'s Technical Reference Guide, Volume Two: AES
Compute!'s Technical Reference Guide, Volume Three: TOS
Atari ST Application Development
Compute!'s ST Applications Guide: Programming in C
Atari ST Internals
Atari ST Tricks and Tips
GFA Basic Book, with disk
A binder of notes on Atari ST hardware
Atari ST Machine Specific Programming in Assembly, printed and in a binder
Professional GEM series, printed and spiral-bound

Applications:
Easy Draw, with SuperCharger, IMG Clip Art, utilities disk
Flash
Base Two
A-Calc Prime
A-Chart

Utilities:
Multidesk Deluxe
Hotwire

Codehead Utilities
Lookit and Popit
G+Plus
Turbo ST
DC Desktop
Universal Item Selector
Migraph Deskjet GDOS drivers

Games:
Flight Simulator II
The Bard's Tale
Red Storm Rising
Phantasie
Golden Path
Impossible Mission 2
The Guild of Thieves
Tower Toppler (no manual)
Gunship (no manual)
Witness (no manual)
The Hitchhiker's Guide to the Galaxy (no manual)

Public Domain collections:
ST Informer: Jul 1987 - Jul 1990; Nov 1990
AIM: Jan 1990 - Mar 1990, May 1990 - Sep 1990
Accusoft: #139, 192, 249, 269, 292, 367, 399, 409, 480, 549, 557

The development documentation contains all the information you need to know to develop for the Atari ST. I don't really want to let it all go, but I haven't had time to spend on ST development for quite a while. That means a great opportunity for you to pick up some great development documentation and tools! I'd prefer to keep the documentation bundle together, since it makes a great set.

Make me an offer on any of this stuff. (The bigger bundle you want, the better deal I'll make you! And no, you can't have my main ST!) Send me mail at andy@jarthur.claremont.edu if you're interested.

From: Geoffrey Spear <gspear+@CMU.EDU>
Message-ID: <4g62Tae00YUnEaAJZX@andrew.cmu.edu>
Source record: 204646

Actually, the new version of NeoDesk was supposedly fixed to work
with MultiGem. I actually have it installed on my HD; I just haven't run
it in about 7 months. Maybe I'll fool with it next, if I ever get my
multi-user MiNT setup to work with ka9q.

As for applications problems under MultiTOS, the 2 things I used
my computer for most when I bought it were calling BBS's (Interlink)
and Word Processing (WordPerfect). WordPerfect just didn't like
MultiGEM at all... every time you select a new window, WP re-activates
its window. As for Interlink, I really had no reason to run it under
MultiGEM, since it doesn't run in a window anyway.

Now I use my computer as a dedicated terminal most of the time,
until recently when I've been hacking MiNT and network software. Still
no reason for MultiGEM. But I did buy it, and it would be nice to at
least have it working...

This .sig is $hareware. If you use it for more than a
month, send me all of your money, then see a
psychologist. Or kill me.

I like UNITERM, it's okay for ANSI too, you don't get the IBM PC graphics,
but it handles all the control codes.

Source record: 204552

```
PageStream
----------
Soft-Logik have confirmed that they do not expect to release PageStream v3
for the ST. They feel that they cannot justify any more work on the project
in the view of poor sales of the current version on the ST. :-(
Source: ST Applications, issue 31.

(Perhaps if they fixed the PostScript screen rendering, more people would
be interested in buying it.)

Falcon
------
Darryl Still, Atari UK's Marketing Manager has confirmed that the Falcon will
appear in the new case later this month, with a substantial prive cut
expected.
Source: ST Applications, issue 31.

(However, Mr Still does not have a great track record for accuracy...)

I have a feeling that the same thing would happen with WP with MultiTOS.
Most GEM programs don't force their window to top, so WP must have been
doing something differently.

With Interlink - did you have access to the ACCessories? If so, then
it would've worked fine with MultiGEM. You don't really need to have
things run in a window somuchas you need access to the ACCessory
area (where the different MultiGEM slots were). For instance, Uniterm
works fine under MultiGEM - the caveat being that you had to switch to
the drop-down menu screen (HELP key) to get at it...

CD-DA (digital audio) uses 2336 bytes of a sector for audio information. CD-ROM
(normally) uses 2048 bytes and spends the rest for error correction and headers.

Yes, the older patches are on a.a., with names beginning with de... (I
don't recall the precise file names). I believe they may still be showing
up in the Newitems directory. If I remember correctly, you have to go from
1.00 to 1.02, then from 1.02 to 1.03.

It's called a press release. And it's not ridiculous. The Jaguar is very real.
The proprietary chips have been sent out for mass production, and there are
games written, with more being developed. This is fact. Believe it.

As far as a Jaguar-based computer... what systems are being used for game development on the Jaguar? I remember that originally Lynx games were done on the Amiga (and who can forget Dave Baggett's post about the Lynx programming team when he visited there?). Does anyone know or is there some other way to find out?

Also, it seems most of the world is pretty skeptical of Atari's claims that they have a 64-bit system "coming soon". I would hope that the people who buy stock are reasonably picky (after all, they were picky enough to make it plummet for quite some time), so perhaps some info about the Falcon or Jaguar has encouraged the surge in price?

I think that this company is Psygnosis - I remember hearing about it a
while ago.

About 4 years ago, I read an interview with Psygnosis, and they were
basically saying that all present hardware was not powerful enough for the
kind of games that they wanted to write, but that they would like to
design their own machine. Maybe the Jaguar is their 'dream machine'.

I've got an all software emulator. It's called Spectre, but I have no hardware with it. I just run the disk and it works! This makes me think it's a non-legit one... I'm looking for a Spectre GCR or Magic Sac since I don't feel so hot about using a pirated copy of such an important piece of software...

Anyway, is there any way to get anything other than the Spectre GCR to read Mac disks? I got a copy of a Shareware program (specstuf.arc) that claims to do this but I haven't tried it and it says you need to register it to get your ST to read Mac disks. Sadly it's not too clear whether it'll let my ST read ANY Mac disk or certain Mac disks or what so I'm hesitant to pay for it. I don't want to end up paying for something that MAY or may NOT do what I need...

So anyway, my questions boil down to these:

What is the program I have called?

What is the easiest and/or cheapestway for me to get my ST to read real Mac 800k disks?

Is the registered specstuf.arc package worth it?

Feel free to post or email...

thanks,

.s.

(While I'm at it, anyone know anything about IMG Scan? I've got the original disk and documentation, but not the hardware. Since I got it second hand, it looks like it got lost or broken or something... Anyone want the disk and docs?)

Ever played a computer game and wished they hadn't put something in, or maybe there was something that would have been better left out?

Ever thought to yourself "If I was the programmer, I would have done it differently"?

Well now's your chance to influence some games programmers!

What type of game do you like best? Shoot-em-up? Role-Player? Strategy? Simulation? etc.

What are your favourite games?

What do you think makes these games good?

Are there any things you would like to change in these games?

Thanks in advance..

Paul

One thing you have to give Atari: they certainly do not do things
the usual way (this can be good or bad at times). Kinda fits in with
the average Atari user's persona - not "following the pack" for
whatever reasons. In any case, in a world where companies like
Wang have faltered (if I read right), Atari is STill chugging along...

>BTW, the stock peaked at 3 and closed today at 2 7/16 (off 1/8) on
>fairly heavy (for Atari) volume.

Since 3 seems to be the current ceiling right now, I would imagine
that once it manages to break through it might accelerate a little
more (of course, I have nil knowledge on the STock scene, so
who knows? :-)

Best advice: Playing the stock market is a lot like gambling. If you can't afford to lose the money you invest, then you shouldn't play. NO ONE can guarantee you the stock will continue to rise and there is no solid reason for Atari's recent upward spurt, which in my mind, makes it a very risky proposition. And don't forget friends, unless you invest big money, broker commissions and such will eat up the profits on a small investment fast. Even if you lose money on a stock, you still have to pay the fees to sell.

I hope they do great! But _my_ money is staying in my pocket.

^^^^^^^^^^^^^

I'm sure that's not what you meant. The Apple II was a 6502 8-bit computer whose ROMs most definitely would not work in the MagicSac _Macintosh_ emulator.

>Problem is, when I put the two together, they don't work. ... The manual (also >dated 1987) states that the Apple ROMS must be 1983 to work, and mine are from >1984.

Bingo. Didn't know there was a difference but Dave should know, eh?

>My question is, is there new software out there to let these ROMs work with >Magic Sac Plus?

Nope. Not that I know of. The MagicSack is no longer supported, anyway.

I can't seem to locate an address for Dave Small, or I would just ask him directly. Dave Small's email address is dsmall@well.sf.ca.us but I don't think he checks in very frequently. He's been pretty much of a ghost lately. You can try to send him a fax at (303)791-0253 or send him mail on GEnie at DAVESMALL. Good luck. ;-)

Rather than spend needless money on trying to get your MagicSak to work, I'd suggest you buy someone's used Spectre GCR off the net. At least then you would have a reasonable Mac clone. The Sak was neat in it's time, but that day has long come and gone. Bottom line... don't throw good money after bad.

> with Magic Sac.

The Magic Sac is the predecessor to the Spectre 128 and Spectre GCR. These
both allow one to use the 128k ROMs (which you want to do). The GCR contains
additional hardware to enable the ST floppies to read/write Mac disks directly.
Both products will essentially emulate a Mac+ at very slightly faster than a
real one (regular STs, I am not sure about STe's, Falcons, TT's, etc.).

> My question is, is there new software out there to let these ROMs work with
> Magic Sac Plus? I can't seem to locate an address for Dave Small, or I would

No, you would need a hardware upgrade as well.

> In the event that I can't get these ROMs to work, I would be in the market for aset of ROM chips that would work. I check on used busted up MAC stuff today
> and found a FUNCTIONING MACII for $380, which would be my last alternative.

I would not put any effort into getting the Magic Sac to work, as it is
old news (you may be able to work out some sort of trade in, perhaps). Your
choices are:

Get a Spectre 128 - excellent Mac emulation, but you have to do more
fiddling due to the inability to read Mac floppies. I have one of
these, and use Dos Mounter (a Mac product) to allow me to use
PC formatted floppies on the desktop with no problems. One can get
the same functionality through Apple File Exchange, included with
the Mac OS (you cannot use them transparently on the desktop, but
it will allow you to transfer from/to a PC disk with no problems).

Get a Spectre GCR - As above, except one can use regular Mac floppies with
no problems.

Get a used Mac - If you are going to do a lot of Mac stuff, this may be
the best way to go, as a used Mac could very well cost you less than
the emulation hardware (and would then free up your ST for other
things while you are Mac'ing, a sort of crude multi-tasking :-).
You should figure in the cost of a separate hard disk.

I really like my Spectre 128, and I use it quite a bit with no problems. I pretty much gave up on ST wordprocessors after getting MS Word for Mac.

DE> But a writable 80MB medium with the MD-format sounds VERY
DE> attractive!

It would indeed, were it not that the data stored on a MD is compressed
useing a compression method where the decompressed data isn't exactly the
same as original data. Some data gets lost. This contributes to a much
better compression ratio and for music the loss of data can not be heard.
(so they want us to believe) But for computer data... nah... kind of
disastrous... ;-)

Picture gotten, solution simple. Upgrade to ICD 6.0.8 and your problems
should be solved. It claims to read/write PC formatted SQ-555 cartridges.
I have not yet tried to swap between PC/ST, but Mac/ST swapping works fine.

I just noticed the "Apple II" up there! For the Magic Sac, you need a set of 64K _Mac_ ROMs. For any kind of real Mac emulation, you need a set of 128k _Mac_ (not Apple II) ROMs.

Hi Rasmus!
The compatibility modes of the F030 (when connected to a VGA/SVGA monitor are only compatible in the behaviour for programms running on the F030 (e.g. memory and register-values) but the frequencies are VGA-compatible.
So are all resolutions switchable from the desktop.
[320,640 * 240,480 (except 320*x in 2cols and 640*x in TC) and the ST modes]

The exact info is on the way.

> 1) who or what cause the price of the stock to change?

All sorts of things affect the price of a stock; press releases, publicity, good/bad news, other people buying/selling the stock on a tip, that certain industry doing good in general (ie (sometimes) when one software stock goes up so do others), insider trading, phases of the moon, etc.

> 2) does Atari send a newsletter/brochure/etc to its stock holders?

Well, they would have to send a stockholder, annual (and probably quarterly) reports. Beyond that; stockholders?

> We might just get caught up in a GOOD catch-22:
> -Atari releases products and stock goes up
> -stock goes up, influencing people to make products for the Atari

Usually, product makers, just care about how many machines are being sold, and not how many shares are being moved... Nice thought, though...

>explain why this increase took place? I mean, has the future of Atari
>Corp ever looked so bad?

Yes and no. In terms of *current product* (Falcon excluded) then
Atari has been rather stagnant, its userbase dwindling, and its support
waning...

"...as idle as a painted ship upon a painted ocean"
(hope I didn't screw up "Rime" too badly here :-)

However, considering they went through a restructuring (which alot
of companies are doing these days - IBM for instance on a grander
scale); have a new product out (the Falcon, Atari Works, MultiTOS);
are implementing a dealer agreement which, though controversial, seems intent
on helping the storefront Atari dealer against mail-order pricing; and are
announcing a new system for the future (Jaguar);...

I would say that at least
in terms of strategy they are acting like a *new* company trying to
make a play for the market rather than an old company trying to
regroup. Throughout all the complaints about the Falcons lateness
showing up, I think more panic buttons would been hit if they tried
to rush it out the door - *that* would've looked like a last
ditch attempt, rather than a new beginning...

Atari's marketing up to this point has been almost non-existant, but their
survival instincts still seem to be intact...

>Falcons.

I don't think that Falcon programmers will have any choice now anyway; it's too difficult to compute instruction timing on a 68020 (on upwards) because of the instruction (and data) cache on these new processors. Far easier (and correct, after all) to rely on the system timers now. Anyone who tries to use software delay loops in a game written for the Falcon is quite simply Doing It Wrong.

553. Re: Atari stock up, up, up (Commodore/Apple down, down, down)

Newsgroup: comp.sys.atari.st
Date: 1993-06-11 18:32:18 UTC
From: aa399@cleveland.Freenet.Edu
Message-ID: <1vaj3i$frk@usenet.INS.CWRU.Edu>
Source record: 204584

Well, there are a number of reasons why Atari's stock is going up
and I'm surprised it isn't near $5 right now.

Commodore International posted a gigantic lost for 1992. This is Atari's
main personal computer competitor. If they are hurting, Atari has a chance
of getting back into the European market. It will take Commodore
a year to get their finances in order after that loss. Atari has already
restructured and is poised to take back what was theirs (Europe).

Apple Computers has a lot of sales, but they aren't making any money!
Atari's SECOND biggest competitor in the personal computer market!
And, Apple doesn't have any new major BREAKTHROUGH products... I still don't
know where Apple DSP computers are... do they exist?

Nintendo recently announced (a month ago) that they are raising the prices
on their game cartridges.

A $50 game will now cost $60. This is because they are located in Japan
and are having a hard time transfering the U.S. dollar.

And let's use our common sense. Sega is located in Japan as well. If Nintendo
is having a hard time, Sega will be following soon.

The Falcon030 is now SHIPPING. This is good news. And better news is that
Atari is increasing production.

The Falcon030 is also the only computer for less than $1400 with a DSP
chip and port. Atari has beat the entire personal computer industry with
including these components.

The Lynx is still a hot product and Bob Brodie said that Garry Tramiel was
visiting major retailers to get them to carry it again. Will Garry be ssuccessful? Maybe...

The Jaguar is probably the biggest reason. Atari is years ahead of the
video game industry with this system. A "64-BIT" video game system folks.
And for $200? All video game players out there (millions and millions)
will buy this system. It is just a matter of Atari producing enough of them
to meet demand.

And what do we have here? Sam Tramiel announces that this system will be
made in the U.S.? This is MAJOR MAJOR MAJOR news.

We are finally going to have a system that we can pick up, look on the bottom,
and see a Made In the U.S.A. sticker. This is a little hard to believe,
but Sam Tramiel did say it...

And what else is Atari working on... a CD-ROM that is twice the speed of
CD-ROM players on the market today? GREAT NEWS.

And how about a Virtual Reality set. Atari has not officially announced it, but I GUARANTEE you that we will release it by the end of 1994.

There is so much good news going on that it is surprising that the stock hasn't hit $5 already. And I believe that $10 would not be surprising either.

The problem is that Atari needs to MANUFACTURE and MARKET these products. Will they find money to do it? I hope so!!!!

Len Stys

Date: 1993-06-11 18:38:46 UTC
From: cwilliso@tuba.calpoly.edu
Message-ID: <1993Jun11.183846.194220@zeus.calpoly.edu>
Source record: 204586

I just recently plucked SOZOBON C v1.33i off the net. I assume this is also called HSC SOZOBON w/ Ian Leppore's VDI&AES, and David Brook's FP lib.

Anyway, I notice that some extra GEM variables have been added to the works by use of a GEMENV.PRG, which installs these variables (PATH:, BIN:, LIB:, ..etc) for the shell to use.

My problem is finding a shell program that is compatible with this set-up. I tried "MUPFEL.PRG" (a german shell), and it has its own little file called "MUPFEL.MUP", in which it steals it variable paths from. Shouldn't the shell automatically see the variables set up by the GEMENV.PRG, and use them???

Does anyone know of a good shell (not fancy--with a prompt), that works smoothly w/ SOZO???

Thanks in advance.

Chris Willison. (cwilliso@tuba.calpoly.edu)

559. Falcon marketing strategey

Newsgroup: comp.sys.atari.st
Date: 1993-06-11 18:56:22 UTC
From: azog@world.std.com
Message-ID: <C8H0M0.8nL@world.std.com>
Source record: 204594

Excuse me for about 10 minutes, but I really need to blow off some
steam here. Unless you can specificlly help me here, dont bother
to reply.

I read in an issue of Znet online mag, that Atari is not allowing
mail order of the Falcon. There was a long explaination regarding
this very stupid move on Ataris part, but I didnt really pay attention
to it.

So I called Cottonwood Computers in CA, and they have the Faclon
IN STOCK (or did when I called). Great! Execpt since I am in NJ
I CANT BUY FROM THEM! SO I get a name and number of a Sam Ask here in
NJ that is a supposed dealer, and since they arent too far away from
me, I call them, in hopes that I can pick it up tonight. Guess again.
They dont have stock, and probably never will. They need to order these
on an as-need basis or some such bullshit, and knowing Atari, that could
take like 6 months.

This is pure crap. Who in Atari made up such a bonehead policy? I dont
really care if they think that a person should see and feel the Falcon
before buying one, I want one regardless! Is Atari such a market giant
that they can stop selling thru what is probably the most successfull
channel (mail ordering), or are they just a bunch of brainless jerks?

Unless you are from Atari, and read this, and can get me a Falcon
today, or unless your from a dealer who has the Falcon in stock and
doesnt care about their fucked up policy and can get me a Falcon
today, dont bother replying.

Or is it time to say bye-bye Atari and get a Mac or Amiga?

This discussion really belongs in the .advocacy group, I think.

I cannot help but remember the last time that there was such a surge in Atari stock prices. The discussion was almost word for word the same as is going on now. That was just before the big stock market crash. Of course, that time the market was pushing to all time high levels, unlike .... hmmmmmm ....

Keep your fingers crossed, and your dollars out of the market unless you can afford to lose them (as has been repeatedly stated here) .

And let's get back to discussiong ST's, not $'s.

>HELP ME! I have about a million questions about GNU C and MiNT.
>For instance, how do I use the MiNTLIB instead of the standard libraries?

You have two choices: either use the MiNT library exclusively, or have them both coexistent on your system. The normal names are gnu.olb (the library) and crt0.o (run-time initialization). The alternate names are mint.olb and mcrt0.o. If you choose to have both libraries on your system you use "gcc -mint" to select the alternate library names. If you have only one version of the library, you may just use the gnu.olb and crt0.o names and never use the -mint flag.

>How do I know I have the latest archives? What are the updates directory

You have the latest archives if you don't see any newer ones :-).

>for? What are the GNU things in the MiNT directory for? How do they
>differ from the archives in the GNU directories (on a.a.u.e). If I want

The updates files contain source code patches for the library and many programs ported to the TOS library, by bammi@cadence.com. If you're only concerned with the library, and not the other programs, then download the most recent version of the TOS library source code and any updates that are more recent, apply any patches for the library from the updates, and then build the patched library. Thanks to Howard Chu we applied pretty much all of the updates to the source archives a few months ago; but things have moved on since then and I'm not sure how in-synch we are at the moment.

The GNU programs in the Mint directory are compiled with the MiNT library. They respond better to MiNT signals and some of them are compiled base-relative (see other threads for related discussion).

>to use GNU C to compile UNIX programs for MiNT and TOS what is the best
>way to do this? And what type of UNIX system should I compile for (sys V,
>BSD, etc.). What are the naming conventions for the libraries, because I

Both libraries provide UNIX emulation. Of course MiNT is more UNIX-like than TOS so it's easier to port some UNIX software to MiNT and the MiNT libraries.

Both libraries currently provide a mishmash of BSD, SysV, and POSIX emulation, and often not very consistently one or the other (though I'd venture that most functions are more SysV-ish.) I'm working on cleaning this up a bit; hopefully in the future you'll be able to

define a preprocessor symbol _POSIX_SOURCE, _BSD_SOURCE, or
_SYSV_SOURCE when compiling your program, to select the emulation type
you desire (this feature is new to the soon-to-be-released patchlevel
32 of the MiNT library, and will be used to select differing
behaviours of setpgrp(), getpgrp(), setjmp(), and longjmp()
functions.) The _BSD_PGRP flag used in patchlevel 31 will be replaced
with _BSD_SOURCE in PL 32.

>want to delete all the archives except for the 16 bit 68000 and 32 bit
>68020, not the other combinations. How do I specifiy the libraries? Will
>GNU C choose the proper variations?

The standard name of the 32 bit library is gnu.olb, and the alternate
name is mint.olb.

The debugger-symbolic-information version (for use with gcc -g) has a
'g' postpended to the basename (e.g. gnug.olb). There is a problem
with the -g flag that produces strange errors and warnings (at least
on my somewhat out-of-date gcc) so these files are not produced by
default for the MiNT library.

The 16 bit library has the number 16 postpended to the base name (e.g.
gnu16.olb).

The base-relative version has a 'b' prepended to the name (e.g.
bgnu.olb, bgnu16.olb).

The 68020/68030 version has 020 postpend, bgnu16.olb).

The 68020/68030 version has 020 postpended to the basename (e.g.
gnu020.olb, gnu16020.olb)

>Anyone know how to use GNU C as a cross-compiler for generating 80x86 code?

Sorry, can't help you with that! (No, I'm not Intel-bashing here, I
just don't know :-)

>Thanks, please send any help to evanlang@sdf.lonestar.org

Hope I've helped...

C= is still doing much better than Atari in Europe. C= U.K. has installed base of over 100,0000 AGA machines, same goes in Germany. Atari at best sold only a few thousand, if they were lucky. Atari has restructured to take back the market, thats a thought, Not!!!! Atari had sales of 10 million in the last quarter versus Apple's two billion in sales.........

>
> Apple Computers has a lot of sales, but they aren't making any money!
> Atari's SECOND biggest competitor in the personal computer market!
> And, Apple doesn't have any new major BREAKTHROUGH products... I still don't
> know where Apple DSP computers are... do they exist?

Apples profits are many times higher than Atari's and C= put together. Apples DSP computers will be out in quantity at MacWorld in August. Apples one day production on DSP macs will be higher than Ataris entire installed base of Falcons. Apples cheapest 040 dsp mac will be about $2000. Expect more price cuts on Macs in the comming days....

You mean shipping 10 Falcons per day...
>
> The Falcon030 is also the only computer for less than $1400 with a DSP
> chip and port. Atari has beat the entire personal computer industry with
> including these components.

What do you mean....I have a two meg Amiga 1200 with eighty megs for under
$900. All the other computer companies have beaten Atari and doesn't consider
it as a competitior. Next month, for about the same price as your $1400
Falcon, you can get a Mac LC520 which is a 25mhz 030 at 32 bit data bus with an
integrated 14 inch sony trinitron with four megs, 80 meg harddisk and a sony
dual speed cdrom drive. Guess who will sell more....

Its fun to rub in reality to Ataridroids the reality of things....
>
> The Lynx is still a hot product and Bob Brodie said that Garry Tramiel was

rry be ssuccessful? Maybe...
Lynx is still hot? Not!!!!!! You just contradicted yourself..... Atari had
10 million in sales last quarter. Atari must have given them away free.

>
> The Jaguar is probably the biggest reason. Atari is years ahead of the

> This is pure crap. Who in Atari made up such a bonehead policy? I dont

Just my $.02 worth. This basically puts Atari in the driver's seat and takes the consumer along for the ride. Generally people shop around until they find the best deal they can. This policy precludes that. Basically, you buy WHAT Atari says WHERE Atari says, and if you don't like it, tough: don't buy it. My reaction will be that I won't buy it. I daresay others will feel the same way. Parts of it is sound business but it simply goes way too far.

> Or is it time to say bye-bye Atari and get a Mac or Amiga?

I can't help wondering the same thing. This policy with the Falcon, and letting major retailers such as Toys "R" Us drop the Lynx, seems to very much be the grand-poobah of stupid mistakes. As a result I've begun to think

1) The people running Atari are bad business men or
2) They're just plain stupid or
3) They're having a really good laugh at all of us idiots who were dumb enough to buy their products.

>Excuse me for about 10 minutes, but I really need to blow off some
>steam here. Unless you can specificlly help me here, dont bother
>to reply.

I love it. People actually bitch to the net like they think it will do them some good. For cripe's sake, write a damn letter to Atari. Or even call them up and complain. Ask for Sam.

>I read in an issue of Znet online mag, that Atari is not allowing
>mail order of the Falcon. There was a long explaination regarding
>this very stupid move on Ataris part, but I didnt really pay attention
>to it.

It's not like they flipped a coin and asked, "Should or shouldn't we allow customers to buy Falcons by mail order?" It was done the way it is to protect dealers from mail order rip-off artists. It's a way to help grow a dealer network. Sure, I can think of other ways (like shipping tons of product) to aid in the development of a network, but apparently Atari can't do that right now, so they gotta do it this way.

>So I called Cottonwood Computers in CA, and they have the Faclon
>*IN STOCK* (or did when I called). Great! Execpt since I am in NJ
>I CANT BUY FROM THEM! SO I get a name and number of a Sam Ask here in
>NJ that is a supposed dealer, and since they arent too far away from

>They dont have stock, and probably never will. They need to order these
>on an as-need basis or some such bullshit, and knowing Atari, that could
>take like 6 months.

Atari's number is 408-745-2000. Tell them you want to buy a Falcon and ask where you can buy one.

Then when you get it, you can post again on the net to tell us how much you love your Falcon, that Atari's such a great company, that you're happy you didn't buy a Mac or Amiga, etc., etc., etc.

I would disagree that Commodore is Atari's main competitor.

>And, Apple doesn't have any new major BREAKTHROUGH products... I still don't

>Well, there are a number of reasons why Atari's stock is going up
>and I'm surprised it isn't near $5 right now.

I can see why Atari's stock is going up a bit, but $5/share would be a bit
too much, too soon.

>The Falcon030 is also the only computer for less than $1400 with a DSP
>chip and port. Atari has beat the entire personal computer industry with
>including these components.

Existence is one thing. Distribution is another. But longtime Atarians know
this very well (and I'm as old as an Atarian can get B-).

>The Lynx is still a hot product and Bob Brodie said that Garry Tramiel was
>visiting major retailers to get them to carry it again. Will Garry be
>successful? Maybe...

Depends. Inside poop I have is that the reason retailers have been dropping
the Lynx recently is because Atari wants cash advance, and the retailers are
saying "no way, Jose". Something like that. Suffice it to say that Atari's
Lynx-distribution problems are of its own making.

>The Jaguar is probably the biggest reason. Atari is years ahead of the
>video game industry with this system. A "64-BIT" video game system folks.
>And for $200? All video game players out there (millions and millions)
>will buy this system. It is just a matter of Atari producing enough of them
>to meet demand.

Distribution, advertising, and games. Waving "64 bits" is not going to sell
units alone -- otherwise, the Lynx would have clobbered the other portable
systems eons ago (they could have waved "16-bit graphics engine", for
example). Don't get me wrong, I'm not saying the Jaguar is horrible or
anything, I'm just saying that, even if Atari does deliver a 64-bit system
for around $200, that's no guarantee of anything.

Atari insiders I know are very enthusiastic about the Jaguar, but it's hard
to tell if it's the usual "something new" enthusiasm, or if there really is a
change in the wind. I mean, let's give Atari some credit, they ARE trying not
to announce something until it's close to shipping.

(Sheesh. We yell at Atari for announcing stuff too soon, and then we yell
at Atari for not announcing stuff until it's ready. The Tramiels may not do
everything right, but the Atari-watching market is hardly the most innocent
spectator, either)

Trivia: The typical retailer, selling a Jaguar with an estimated street price of $200, will only make $8 profit. Everyone is counting on cartridge sales for the big profits.

>And what do we have here? Sam Tramiel announces that this system will be >made in the U.S.? This is MAJOR MAJOR MAJOR news.

We'll see. I still remember the "New Taiwan plants" and "new Israel plants" articles from a few years back.

>And what else is Atari working on... a CD-ROM that is twice the speed of >CD-ROM players on the market today? GREAT NEWS.

Not for the Atari computer line, that got abandoned long ago. If you are referring to a possible-Jaguar-CD-ROM thing, I'd say to wait for the main console first before we get too enthusiastic.

>And how about a Virtual Reality set. Atari has not officially announced it, >but I GUARANTEE you that we will release it by the end of 1994.

Now, now, Len. This is where you start losing credibility...

>There is so much good news going on that it is surprising that the stock >hasn't hit $5 already. And I believe that $10 would not be surprising either.

A stock market analysis may raise Atari's price on the Falcon distribution and the Jaguar press release, but that's it. There's not enough substance on anything else to justify buy-mania on Atari just yet.

>The problem is that Atari needs to MANUFACTURE and MARKET these products.

Don't forget DISTRIBUTE.

>Will they find money to do it? I hope so!!!!

Someone want to buy the Tramiels a lottery ticket? This week's California Lottery jackpot is $16 million...

570. MiNT

Newsgroup: comp.sys.atari.st
Date: 1993-06-12 02:56:25 UTC
From: evanlang@sdf.lonestar.org
Message-ID: <C8HMu2.JqH@sdf.lonestar.org>
Source record: 204694
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I've compiled MiNT 1.04 but the MINIX.XFS crashes my system now. How can I fix it? I've tried to recompile MINIX.XFS but GCC gives about a thousand warnings and then gives up and tells me Error 1. If anyone has a version of MINIX.XFS that actually works with MiNT 1.04 then please E-Mail it to me. My address is evanlang@sdf.lonestar.org

The second problem is that many programs die a horrible death. MiNT tells me it encountered an illegal instruction, and I KNOW these programs don't have any illegal instructions. Could MiNT itself have gotten some non-68000 instruction in the compilation by mistake. For instance, I can crash the system just by first moving the item selector (LGSELECT), and then clicking outside the selector. Instead of dinging, it crashes with illegal instruction. If I do this from within a program instead of from the desktop then I can continue, the next file selector call pulls up the standard selector. And any program that crashes does NOT free memory properly (after 3 or 4 crashes of a decent size program, I run out of RAM, on a 4MB machine)!!!

Next is that when I compiled MiNT, the Dlock function had aliasdrv defined as an external declaration, and it shouldn't have been (according to GCC - file dosdir.c, lines 1254, and 46). How can I fix this, and has anyone else had thisproblem?

t also couldn't find prgflags. The only one I have is a GEM version, where do I get a TOS version that accepts the same arguments that MiNT's makefile wants to send it (I just set the 2 TT flags and the fastload flag)? If it's uuae then give me a full path and filename so's I can get it.

If anyone that knows is reading, like ERS, can I get bios device numbers for devices by using Fxattr on the files in the U:\dev\ directory? It didn't seem to work (should it have worked and I just programmed it wrong?). How does one find out if \dev\aux and \dev\modem2 refer to the same device without checking in the Bios (my idea was to use Fxattr and check the 'dev' field.

OK, where can I get developer documentation for MiNT/MultiTOS. I have some man pages for v.0.9 of MiNT but those are highly outdated it seems, and it doesn't tell how to use the "modified" versions of old OS calls. It looks like Fopen has some new options?? I didn't see an Flock in the manual pages, is this in MiNT, is it automatic, or it is a flag used in the Fopen mode?? File locking is pretty important in a multitasking enviroment. Also, I wanted to use Dlock to lock serial ports by getting their device numbers as above. But I have no idea at all if that will work (I think it should work that way, but what do I know???!!)

Let's see here ... I guess that's the last question, for now. Thanks...

evanlang@sdf.lonestar.org

EN> The *.app seems a pretty useless recent addition to the *.tos *.ttp
EN> *.prg and *.gtp series.

.APP files are a hold over from the GEM sysem. They _used_ to mean programs
that would make use of the GEM system, a fairly moot point on the Atari line.

TOS 1.0 allowed .APP programs, so there's nothing recient about them.

574. Serial port sending ^S at wrong time?

Newsgroup: comp.sys.atari.st
Date: 1993-06-12 16:55:39 UTC
From: cummins@a.cs.okstate.edu
Message-ID: <1993Jun12.165539.29470@a.cs.okstate.edu>
Source record: 204654

I'm using TOS 1.4 (1.04 for the rest of you) and have a data dtream from my modem that overruns the ST occaisionally. When that happens, I notice about 2 garbled lines of text and then the data stops until I hit ^Q to restart it.

I'm trying to isolate the source of the ^S that stops the data flow and then figure out why rts/cts aren't functioning.

tos14fix
poolfx92 (Auto folder)
serialfx
uisIII

Along with superboot 7.4 is all I have in the auto folder presently. I've unloaded the "CPX" accessory.... lessee....

no accessories loaded.

Any ideas? (email if you like to cummins@a.cs.okstate.edu)

jc

Matija.Grabnar@ijs.si (Matija Grabnar) writes:

>I expect to buy a Falcon and a SVGA monitor within the next month or so.

If you want to install *any* resolution extension (Hardware: BlowUp030, Screenblaster or Software: FalconScreen2 (PD), BlowUp030(Soft) or BlowUP(from ddd), you should get the best monitor you can afford. The monitor should scan the horizontal frequency from (at least) 30 to 50 kHz. These monitors are often (but not always) called Multiscan monitors. If you want to use the RGB/TV resolutions on the same monitor it should scan down to 15 kHz.

>Can anybody please tell me what is the difference between screen blaster
>and BlowUp030? Will NVDI Falcon work with both?

The hardware seems to work similar but the software of both are very different:

With Screenblaster you have to use the 10 or 15 resolutions the programmers meant were nice. Every time you boot or switch the resolution you get a TOS-Screen where you have to select your next resolution. I've seen it at a local dealer in V0.9beta and it seems neither flexible nor user-friendly.

The BlowUp030 Software allows you to set any resolution at any vertical frequency interlaced or noninterlaced (if the FALCON is fast enough and the monitor good enough for that). You can use many sliders to manipulate Vsync, Hsync, etc. in order to get the best picture on your monitor. You can save for each colour mode (2, 4, 16, 256, TC) two favourite resolutions. With a small ACC (PRG) you now can set your default resolutions for each colour mode (User defined 1 and 2 and the original resolution). If you change the number of colours on the desktop the default resolution will appear without rebooting or a bad TOS-Screen. The compatibility modes still work fine.

Both products support virtual screen (very fast and really nice).

NVDI 2.50 works fine with both Hardware products but not with FalconScreen2. The problem is that the author of FalconScreen still didn't receive the NVDI-Update!

>Should I take both? How much would they cost and where can I buy them in
>Germany or Austria?

Both makes no sense until you can use only one of them the same time.

Screenblaster (Overcan GbR, Berlin) costs DM 149.- and DM 199.- with NVDI 2.5 (without manual). BlowUp030 Hard 2 (EMail: acher@informatik.tu-muenchen.de) costs DM 129.-.

>take like 6 months.

I'm sure it isn't this dealers fault. Atari most likely shipped the
Falcon030 to those that ordered them in large quantities a long time ago.
The dealer probably doesn't have any because there are no Falcon030s
to send him!

You as might as well order it from this dealer and encourage him to
get Atari to rush the unit to him.

>
>This is pure crap. Who in Atari made up such a bonehead policy? I dont

No, the policy is a smart idea. But, they still need a lot more Atari
Dealers in the U.S.

If your nearest Atari dealer doesn't have one or doesn't plan on getting
any for awhile, find the NEXT nearest Atari dealer and get it from him.

582. Cleveland Free-Net Atari SIG needs Atari News SysOp

Newsgroup: comp.sys.atari.st
Date: 1993-06-13 16:04:03 UTC
From: xx004@cleveland.Freenet.Edu
Message-ID: <1vfj5j$2jv@usenet.INS.CWRU.Edu>
Source record: 204661

The Cleveland Free-Net Atari SIG needs an Atari News SysOp.

At the Atari SIG, we are working hard to establish a great information source
for ALL Atari users.

Presently, the Atari SIG is looking for an Atari News SysOp. If you love
to hear about Atari news and enjoy getting the word out, this position
if definitely for you!

This is a volunteer position, but there are many perks that you will enjoy
as being an Atari SIGOp.

One is the fact that you will have unlimited time access to the Cleveland
Free-Net. Another is that you will get to know many people in the Atari
Community. Third, you will be working with other SysOps to establish something
that has never been done before--a ___FREE___ Atari SIG that is comparable
to that of GEnie's and Compuserve's.

Eventually, we hope that we will be able to distribute the news that you
obtain to Atari SIGs on different Free-Nets throughout the nation.

If you enjoy Atari news and the Atari Community, you will love the position
of Atari News SysOp.

These are the qualifications:

A Cleveland Free-Net ID and password (if you don't have one now, get one!)

Perseverance -- this is a BIG one. As you may know, the happenings of Atari
do not always brighten people's day. This means that you
will need to keep at it even though things look grim.
Also, it will take work for your ATARI NEWS area on the
Atari SIG to become a popular source of Atari News. THIS
WILL EVENTUALLY HAPPEN THOUGH!

Dependability -- you will need to use the Free-Net system and Atari SIG
at least twice week. Some Atari SysOps check in three or
four times a week, while others every day.

Long-term stay -- A long-term stay has to be in mind. Unless you plan
to stay around for awhile (longer than 6 months) and make
a name for yourself and the Atari SIG, don't apply.

Ability to work -- The ability to work with people is important because this
with people is the only way the Atari SIG will be successful
This ability is the key to the Atari SIG's success.

____ TIME ____ -- This is very important. Many people just don't have time
with everything going in their lives. The prese don't have time. But, if you think you can
make yourself
some time (a minimum of 6 hours a week) then you will be in great
shape.

The need for devotion is an important part of being an Atari SIGOp.
You must be devoted to the Atari SIG. Our main goal is to create an information
source for Atari SIG that cannot be beat. We understand that Free-Net
isn't a commercial system, but we believe we can do it anyways.

If you are interested in the position, please write the Atari SIG at
xx004@cleveland.freenet.edu

Please include some information about yourself (where you live, what you do,
how long have you used Atari products, etc.)

Thank you.

Sincerely,

Len Stys

584. JAGUAR: Anyone Have Any Specs???

Newsgroup: comp.sys.atari.st
Date: 1993-06-13 20:46:40 UTC
From: totty@flute.cs.uiuc.edu
Message-ID: <C8Kv1s.BIM@cs.uiuc.edu>
Source record: 204662

This might not be the right group to post this question, but all this talk about Atari stock rising because of the Jaguar video game machine has me interested...

Could some kind soul describe the (possibly rumored) hardware of the Jaguar (or point me to a FAQ list)? What exactly is "64 bits" about this machine? Is it 64 bit color? 64 bit sampled sound? It seems extremely unlikely that a commercial 64 bit processor could be afforded for a game machine (or even necessary), and equally unlikely that would would have the ability or desire to custom-design one. Can someone clarify this?

Any other scoop on the internal details?

: I think Atari (U.S.) intends on marketing a DSP modem in the future.
: Bob Brodie sort of mentioned the idea in his latest GEnie RTC (get
: the latest Znet for the full transcript). Dunno if there's any
: currently available, however...

I attended the Atari debut of the Falcon 030 at the Boston Computer Society show last September (it was the same place the Atari 520ST was announced in 1985 to the world). I posted an article to this USENet newsgroup and it was republished (electronically) in Atari Explorer On-line.

In that demonstration, Sam Tramiel said that a 3rd party manufacturer was creating the international phone adaptor interface for the Falcon 030's DSP port. I believe (from memory) he said that it should be out by the first quarter of 1994. From there, one only needs software to do a virtual modem or fax machine over the phone lines.

WHy don't you simply call ICD BBS and D/L the lastest software? I did about a month ago because it is the only official electronic means to get the software for free. (Unless you order it, not free! But the professional versions carry additional features, you learn about that in the P/D release of 6.0.2. Dated '92)

So,WHY don't somebody downloaded the files from ICD (Pd-version,of course)
and uploaded it to some common sites like a.a. or ftp-kl? This should end
this senseless discussion.

> a year to get their finances in order after that loss. Atari has already
> restructured and is poised to take back what was theirs (Europe).

Yah, but they've been selling A1200s for _months_ now... I still
haven't heard of a for-sale Falcon in Canada.

> Apple Computers has a lot of sales, but they aren't making any money!
> Atari's SECOND biggest competitor in the personal computer market!
> And, Apple doesn't have any new major BREAKTHROUGH products... I still don't
> know where Apple DSP computers are... do they exist?

Does anyone care? Apple's presence is utterly overwhelming; they sold
more PowerBooks last year than Atari has sold STs/TTs/STes/Falcons ever.

> The Falcon030 is now SHIPPING. This is good news. And better news is that
> Atari is increasing production.

Shipping to where? 10 units per week?

> The Falcon030 is also the only computer for less than $1400 with a DSP
> chip and port. Atari has beat the entire personal computer industry with
> including these components.

We still haven't seen much of a use for this by "normal" people (ie,
people who aren't musicians). Sure, you can use it for JPEG
decompression, etc, but the extra horsepower in a '486 or '040 will go a
lot further than the DSP can... It'll speed up the whole system, not
just a few rarely-used operations.

> The Lynx is still a hot product and Bob Brodie said that Garry Tramiel was
> visiting major retailers to get them to carry it again. Will Garry be ssuccessful?
Maybe...

From what I've heard (from _developers_) if Gary is talking to them, you
should expect more to be dropping the Lynx...

> The Jaguar is probably the biggest reason. Atari is years ahead of the
> video game industry with this system. A "64-BIT" video game system folks.
> And for $200? All video game players out there (millions and millions)
> will buy this system. It is just a matter of Atari producing enough of them
> to meet demand.

I think this is about as likely as seeing a balanced budget in the US;
everyone talks about doing it, but there's no way they can. If it is
available within a year of now, I'll be very surprised.

> And what do we have here? Sam Tramiel announces that this system will be
> made in the U.S.? This is MAJOR MAJOR MAJOR news.

For people in the US; other people might not have such a good opinion of
Made in the US products (I certainly wouldn't buy an American-made car)...

> And what else is Atari working on... a CD-ROM that is twice the speed of
> CD-ROM players on the market today? GREAT NEWS.

Dozens of these DoubleSpin drives are already on the market, being sold
by companies with better reputations than Atari (ie, NEC, Sony, etc).

> And how about a Virtual Reality set. Atari has not officially announced it,
> but I GUARANTEE you that we will release it by the end of 1994.

We probably won't even see a faster Falcon model by then.

The higher-ups at Atari like to think they're Apple... In the past
three years or so, the _only_ way to get any sort of Atari hardware or
software has been through mail-order.

>Atari's SECOND biggest competitor in the personal computer market!
>And, Apple doesn't have any new major BREAKTHROUGH products... I still don't
>know where Apple DSP computers are... do they exist?

First. Apple is making money. Lots of it. The are making less profit
this year than before, but are selling lots more product. Note, they are
STILL making money, just less than before. In return, they are lowing prices
and going for volume. Many Wall Streeters didn't think they could make this
transition, but they still seem to be doing well. Apple also claims that
CPU sales will skyrocket once the DSP macs are releaed, and that Newton will
make loads of money on realease (but, of course they would say something like
that....)

The DSP macs aren't supposed to be out till this summer. That when evey-
one said they were due out, so Apple ain't even late yet and you're calling
them into question! If the DSP macs can do do what Apple says they can do,
then I think they might classify as
revolutionary. Of course, with the Newton being so late, maybe the DSP
macs will too.

>The Falcon030 is also the only computer for less than $1400 with a DSP
>chip and port. Atari has beat the entire personal computer industry with
>including these components.

This is the thing that Atari really has going for it. I don't really know
what market this makes for Atari, but it is a plus for the machine. Mainly
because it is shipping now, if some of the rumors are true of about the
Tempest (the DSP macs) then it might have some stiff competition, especially
since, to a professional, the price difference might be worth it.

>The Lynx is still a hot product and Bob Brodie said that Garry Tramiel was
>visiting major retailers to get them to carry it again. Will Garry be ssuccessful?
Maybe...

God I hope so....I have one! (Though that Sega game gear looks nice as well,
and isn't that much more!)

>The Jaguar is probably the biggest reason. Atari is years ahead of the
>video game industry with this system. A "64-BIT" video game system folks.
>And for $200? All video game players out there (millions and millions)
>will buy this system. It is just a matter of Atari producing enough of them
>to meet demand.

Cynical as it sounds, I think the Jag might be feuling the recent rise in stock. It's rumored capabilities put it beyond any competition other than the 3d0 which will cost much more. I think this excites investors more than the release of a new "bit" player computer. (That IS how they will view the Falcon...and they won't be able to see one to decide otherwise!)

>And what do we have here? Sam Tramiel announces that this system will be
>made in the U.S.? This is MAJOR MAJOR MAJOR news.

I missed that. That sounds like a great move on Atari's part. They have more control over production (closer) and get the positive press of being "American made" in an industry dominated by Jap. companies. I hope it's all it's cracked up to be...because tech. superiority, American made, all for a slight price increase just might work. (Of course, I hope all the rumored games are out on release...this is VITAL, so I don't think that Atari will overlook it. Let's hope this is why the new-Lynx games aren't popping up as fast as they should.

>And what else is Atari working on... a CD-ROM that is twice the speed of
>CD-ROM players on the market today? GREAT NEWS.

Do you mean the dual speed CD-ROM players. Like the one that Apple has had out for awhile now? (They were one of the first.) Or were you talking about game consoles still? If so, I wonder if it'll be able to hook up to the Falcon?

>And how about a Virtual Reality set. Atari has not officially announced it,
>but I GUARANTEE you that we will release it by the end of 1994.

Is this to run off the Jag? I think I just might have to buy one....well I'll decide after I see it.

>The problem is that Atari needs to MANUFACTURE and MARKET these products.
>Will they find money to do it? I hope so!!!!

Amen!

Hello,

I'd like to have a latex environment on my ST, because I use it as
a student. I dont want to print documents made with it at home, I
just want to prepare and debug sources.
I have seen that there were many implementation of it, so what is
the best one (compiler and previewer), and what place we need on
hard disk.
And by the way where can I find this good implementation.

I just thought I'd mention that if you look in DC comics you will see
a full page advertisment for Atari LYNX. I've been reading Superman comics
since his recent demise and every comic this July has had a LYNX advert of
some kind.

Obviously Atari are pushing their products still!

Cross-posted to: comp.os.minix,comp.sys.atari.st,comp.sys.atari.st.tech

Dear folks,

Please help me.

I recently bought Minix v1.5 for the Atari ST, second hand.

My problem seems to be that I cannot install it onto my hard drive, because of the fact that my controller is not recognised by minix using the command:

dd if=/dev/hd5 of=/dev/null count=200

I get the error message:
0.00 in
0.00 out

My set up is:
Atari 1040 STe with 2Mb RAM and TOS 2.06
720 K external Disk Drive
48 Mb Disk Drives Ltd Autobooting Hard Disk.
the components of which are:
48Mb Seagate ST157N SCSI Disc
Disc Drives Ltd DMA-SCSI interface
SCSI out, DMA out ports
Inbuilt clock
Switch for SCSI and AHDI compatability.
I use the SCSI compatability option (however, I tried the AHDI with minix and it still did not work).
Mono and Coulour monitors
Daatascan Scanner.

All the above are plugged in at the same time.

Is there any way of getting around this problem without having to resort to buying another interface?

I have tried to get in touch with Disc Drives Ltd, but it seems that they do not exist anymore. Even the reputable companies here haven't heard of them. The company was based in Kent.

I bought the drive second hand, so I do not know who to turn to.

Please help.

Semi-flame on:

In article frk@usenet.INS.CWRU.Edu, aa399@cleveland.Freenet.Edu (Len Stys) writes:

"> "Apple Computers has a lot of sales, but they aren't making any money!
"> "Atari's SECOND biggest competitor in the personal computer market!
"> "And, Apple doesn't have any new major BREAKTHROUGH products... I still don't
"> "know where Apple DSP computers are... do they exist?

Where are you getting your facts? You can't even compare Apple and Atari! Apple
may not be doing as well as it used to, but it's still making a healthy profit -
unlike Atari. As far as the number of units-shipped are concerned, I would venture
to guess that Apple is selling more in a week than Atari is selling in a year (not
based on fact, but just look at the difference in earnings!) As far as "breakthrough"
products are concerned: I guess you define "breakthrough" as "a computer with
a DSP?" Apple's PDA (supposedly out this summer) probably qualifies as a breakthrough
in anybody else's book.
I don't know if Apple has a DSP in any of their computers (don't own one, so I
can't speak from expertise) but I'm pretty sure there're 3rd party vendors selling
boards for it -- IFF there's a market for it.)

"> "A $50 game will now cost $60. This is because they are located in Japan
"> "and are having a hard time transfering the U.S. dollar.
"> "
"> "And let's use our common sense. Sega is located in Japan as well. If Nintendo
"> "is having a hard time, Sega will be following soon.

...so they will be shipping xxxxxxxx - y units instead of just xxxxxxxx? Give me
a break. Atari in their own yearly statement admits that their game machines are
no longer competitive with Nintendo/Sega.

"> "The Falcon030 is also the only computer for less than $1400 with a DSP
"> "chip and port. Atari has beat the entire personal computer industry with
"> "including these components.

You keep going back to the DSP as if it's some sort of Holy Grail of computer
architecture. There are 3rd party vendors selling boards with DSP for PC clones.
I don't see the 20+ million PC customers out there flocking to those products.
Aside from the DSP (and some other nice features for the "music niche market") what
does the Falcon really have to offer that hasn't existed in the PC and Mac world
for a couple of years?
...
"> "The Jaguar is probably the biggest reason. Atari is years ahead of the
"> "video game industry with this system. A "64-BIT" video game system folks.
"> "And for $200? All video game players out there (millions and millions)
"> "will buy this system. It is just a matter of Atari producing enough of them

"> "to meet demand.

An announcement does not a system make. Clearly you're right in one respect:
The Jaguar is the most sophisticated game machine ANNOUNCED so far...but so
was the Lynx when it was ANNOUNCED (it was the first color portable system at
the time.) But by the time it shipped in quantity, Sega had come out with a
color portable of their own.

"> "
"> "And what do we have here? Sam Tramiel announces that this system will be
"> "made in the U.S.? This is MAJOR MAJOR MAJOR news.
"> "
"> "We are finally going to have a system that we can pick up, look on the bottom,
"> "and see a Made In the U.S.A. sticker. This is a little hard to believe,
"> "but Sam Tramiel did say it...

Even you're skeptical on that one, eh? :-)

"> "And how about a Virtual Reality set. Atari has not officially announced it,
"> "but I GUARANTEE you that we will release it by the end of 1994.
^^

"> "There is so much good news going on that it is surprising that the stock
"> "hasn't hit $5 already. And I believe that $10 would not be surprising either.

If you're so convinced, why don't you take out a loan and buy a few thousand
shares?

"> "The problem is that Atari needs to MANUFACTURE and MARKET these products.
"> "Will they find money to do it? I hope so!!!!

That has always been the problem. What makes you think it will change?

Semi-flame off.

Apologies to the net. I don't usually flame others like this, but this mindless
cheerleading in the face of reality is getting a little ridiculous. I've had
my ST for 6 years (granted I haven't used if for over 4 :-) but I do try to keep
my feet planted on this earth.

Tom

600. MDK tar is faulty(maybe)

Newsgroup: comp.sys.atari.st
Date: 1993-06-14 13:58:14 UTC
From: sjg@phlem.ph.kcl.ac.uk
Message-ID: <1993Jun14.135814.1142@sol.ctr.columbia.edu>
Source record: 204674
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

A word of warning here.

I've just had an error under minixfs 0.6p4 that fsck couldn't cure
(I ran it several times, and all it did was alter the location as
far as I could see). Anyway, I decided to tar everything to floppies,
run the new minit and untar back from floppy. Tarring went fine...

tar cvMf /a/unix.tar

[Create Verbose Multivol tarFile]

... for multi-volume archives (it just asks
you to put in a new disk when it gets full). So then I minit'd the
disk, and started to re-install...

tar xvMf /a/unix.tar

... which worked great for the 1st floppy.
Then it said "put in vol #2..." and I did, and it said this was out
of sequence. (alarms start ringing). The problem was that tar had
the wrong blocking factor (between the end of the files on vol #1
and the beginning of the files on vol #2 it had missed bytes, so it
couldn't restore the files which traversed volumes. Oh B***er.)
(B***er == Bother, for the humour impaired :-)

So, my advice (if you use tar to back up) is to set the amount that
tar writes to each volume (using the -b option), otherwise you'll lose
stuff.

It's quite an amazing proof of Sod's law, actually. I mean, I didn't
lose anything useless - it was stuff like gcc-cc1p, gcc-cc1, tcsh, ls,
rm, mv etc. Incredible!

I'm writing a newer version of SETUP and INSTALL using Warwick's gem++
library. Hopefully this will sort out the problems GFA was having with
TOS versions less than 1.4... At least, this is my excuse for why I've
not done anything to the MDK for the last month or so...

Simon.

I'm writing code to grab midi data and retransmit it on the RS232 port
so I can send/recieve MIDI stuff on my Sun. It works ok as long as the
block of data from the MIDI device is smallish. When I dump all patches
in my MIDI FX, I seem to be loosing some data.

None of this is a surprise. I'm using Turbo C/Bconin/Bconout to talk to
the ports, so I tried prioritising my polling (eg only think about doing
anything else if there's no MIDI data to read) and buffering the MIDI port
in my code (ie made MIDI read a tight loop to grab data & stuff in a buffer)
which helps, but it's still less than ideal. What I really need to do
is either:

a) Increase the hardware buffer associated with the MIDI port
to ~6K (is this possible?)

b) Use assembler routines, preferably interrupt driven, to get
MIDI data and stuff it into a software buffer.

I've done b) before with a lowly Sinclair(Timex?) ZXspectrum and it managed
to keep up with MIDI traffic, I'd like to do the same with the ST.

I need help with how to do this. I would prefer to use C, but could use
assembler though I don't know much about 68000. Can anyone offer help?
Things like "Here's an assembler routine to handle interrupts caused by
MIDI data arriving" get a BIG gold star, though even little things like
references to other code, books, etc are all gratefully received.

Here's hoping....

If you truly don't want to use pirated software, then just DON'T. Please... format that disk now! It's an insult to software developer's everywhere. Not only did the pirates' steal Dave Small's code, they also copied the Mac ROM code to the disk. It's very buggy and illegal as hell. Dump it.

Wow, I have never seen people get this upset over a little good news from Atari. It's funny (but sad) to see such apples vs. oranges comparisons like " but the extra horsepower in a '486 or '040 will go a lot further than the DSP can...". Yea, and the HP 9000 sitting next to me will blow away a 486 40 (see how stupid that kind of bashing sounds).

If people think that it is their duty to keep the good spirits of Atari users 'in check', they not only have a lot of free time on their hands, but could do us all a favor and take their net-police activities to the .advocacy group.

(Brian Totty) writes:
>Could some kind soul describe the (possibly rumored) hardware of the
>Jaguar (or point me to a FAQ list)?

From the Atari 1992 Annual Report (Just Issued):

---------- Quotation Begins ----------

The Company is developing a new interactive multimedia console based on proprietary custom semiconductor chips, including a 64-bit RISC processor. This multimedia console is code named "Jaguar".

The video features include 24-bit graphics with up to 16 million colors and a 3-D rendering engine which can manipulate 3-D polygon shapes in a "real" world in real time. The "Jaguar" also has real time texture mapping and can create special video effects. We anticipate the video output on "Jaguar" will be far superior to video games available today and will allow for more realistic simulations for moving vehicles such as spaceships, cars, airplanes and figures.

The entertainment software for the system will be first available on ROM cartridge.

The sound system is based on a high-speed custom Digital Signal Processor dedicated to audio. The audio is stereo 16-bit CD quality and can be processed from simultaneous sources of audio data. This allows for very realistic sounds to be used during software design as well as human voices.

The "Jaguar" will include a 32-bit expansion port which will allow for future connection into cable and telephone networks when such opportunities arise. There also will be a radio processing port for modem use and for connection to digital audio peripherals such as DAT players.

The Company is also developing a compact disc peripheral for "Jaguar". Software developed for this media can take advantage of lower media cost, capacity (up to 650 megabytes) and additional flexibility in the area of full motion video (FMV), voice and music. In the future, "Jaguar" will be able to connect a cartridge into the 32-bit expansion port which will allow for FMV playback at VHS quality. The compact disc peripheral is double-speed and is being designed to also play regular CD audio, CD+G (graphics) and Kodak's new Photo-CD.

The Company is developing ROM-based software for "Jaguar" concurrent with the hardware development.

---------- Quotation Ends ---------------------------------

Remember, this is from the annual report, and is written in such
a way as to "dazzle" existing and potential stockholders. We ST'ers
have heard annual rumors about CD-ROM before, but Atari *might* be
serious this time.

Copies of the Atari Corp. annual report should be available at no
charge, on request. Send your request to: Sam Tramiel, Shareholder
Relations (even if you aren't a shareholder ... um ... _yet_ :), Atari
Corporation, 1196 Borregas Avenue, Sunnyvale, CA 94089-1302. No, I do
not know if they'll send them to addresses outside of the USA -- but you
can always try!

609. Information in disk access for atari computers

Newsgroup: comp.sys.atari.st
Date: 1993-06-14 16:42:03 UTC
From: jra37189@uxa.cso.uiuc.edu
Message-ID: <C8MEE3.n2p@news.cso.uiuc.edu>
Source record: 204517
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st

Hi. I didn't know exactly where to post this, because I only
have limited information about what I supposed to be asking. Anyway,
I was wondering if someone had a brief list of disk access commands
(directory listing, loading, saving, that sort of thing) for atari
computers. I have a friend who picked up a couple of computers,
printer, disk drives, modem, and about 100 disks for around $30!
Anyway, the problem is that the stuff didn't have any manuals to it,
and so he doesn't really know how to use any of it. I don't remember
exactly what the computers are...I think one is an 800 something or
other. Anyway, if someone could e-mail me some helpful commands,
I would greatly appreciate it. About all we're really interested in
right now is disk access commands, but if you had anything else helpful,
that'd be cool too! Thanks in advance.

Source record: 204686

I'm trying to write a small program in GFA BASIC 3.5 and have a question on graphics. I would like to be able to achieve an effect I have seen in music programs in which notes can be overlaid on a staff and other notes by clicking with the mouse, and later removed by mouse click leaving the underlying images complete.

The programs which do this were written in c, a language I do not currently own. Is there a SIMPLE way to accomplish this in GFA Basic? Thanks.

Source record: 204690

I've just got cs-tex-4 for my falcon, although I'm sure it was written for the ST. I'm very pleased with it, although its eaten about 10Megs of my hard drive, I think I can delete some stuff though.

I ftp'd it from src.doc.ic.ac.uk /computing/systems/atari/umich/Tex/Cs-tex-4 (or there abouts!) which I think is a 'mirror' of atari.archive. It comes in 8 compressed files - a floppy full each, so get some disks!

The documentation is mainly in German, but there is just enough English to get by if, like me, your German is not too hot. The shell program comes in an English and German version, although the supporting programs are all German. The DVI viewer is very good and fast (especially on a Falcon!). Its dead easy to install too.

Alternatively there seems to be loads of other versions around the ftp sites, but I've not needed to bother looking any further.

I hope thats some help...

Andrew

>So anyway, my questions boil down to these:
>What is the program I have called?

hutch> It's called THEFT. But then, you know that don't you?

Easy there, killer... I got the thing when I bought my used 1040ST
and was asking what it was in order to find out if it was legal or
pirated (the disk has a printed label saying just "Spectre"). Now
perhaps you can help me instead of yelling at/near me. Did Dave Small
ever make a software-only version of Spectre?

The answer to that is - no, the elusive hack of Gadgets by Small did not make
a software only version. To my knowledge, there was an older version called
Spectre 128 using older Mac ROM chips, and the latest version, called Spectre
GCR, which uses newer version Mac ROMs. Both versions involve a cartridge that
plugs into the external card port on your ST.

>What is the easiest and/or cheapestway for me to get my ST to read
>real Mac 800k disks?

The only way I know of to emulate anything close to a later model Mac is with
Spectre GCR, V. 3.0. (System 6.X.X only - no system 7).

hutch> Find someone selling a used Spectre GCR with Mac ROMs here on
hutch> the net.

Now that really is helpful. What's a good price for a GCR with the
ROMs? And do I then need to buy a mac external drive or will it allow
my ST's internal drive to read mac disks? If not, is there any way to
get the STs internal drive to read mac disks?
```

Spectre GCR allows you to use your Atari 720K drive - albeit with bugs. There will be countless Spectre users who swear that their Spectre GCR works flawless ly, but take it from me, I get TONS of E-mail and there are dozens of posts on this net (including myself) from people who have serious problems using Spectre GCR, particularly on newer model STs (Mega STe, for example). I think you'll be OK with a 1040 ST. I would not pay any more than $150 for Spectre GCR and ROMs. Any more than that, and you may as well buy an older, used Mac. Remember, even with an old Mac, you will have the resources of Apple Corp. and countless dealers to assist you. If you get Spectre GCR, you will not get any support from the one-man operation called Gadgets by Small. (If you don't believe me, Dave Small apologists - just read the post that immediately precedes the one I am replying to.)

thanks again,
.s.

Well I had heard that the policy does NOT mean no mail-order. It means that
you can only sell Falcon's if you have a store-front. That means you CAN get
computers sent to your address (mail order) from a regular Atari dealer that
has a store-front. It also means you can buy from Music stores since they
almost always have a store front! Who buys guitars mail-order only?

What is the DVI previewer called? I've always considered Atari DVI previewers to be slow compared to their MSDOS equivalents, ever tried the emTeX previewer, its very fast and uses the printer fonts at 300dpi, very nice screen. The other thing I don't like about Atari previewers is that they need their own fonts at an ugly screen resolution (eg 96dpi or something similar) instead of using the printer 300dpi fonts. This means of course that one has to have two sets of fonts on your hard disk. Trouble is if you do get them to use 300dpi they don't have good enough zoom and unzoom facilities to get the best out of the 300dpi fonts. Anybody know of a previewer that can do all this?

Herb

620. GNU textutils v1.6 are corrupt

Does anyone out there in net.land know anything about the Japanese
word processor that's in a.a.u.e. ? The version in umich is V1.80
while it's dictionary is V1.26. The programmer is/was M. Utashiro.
If anyone can tell me where to get newer versions of this great piece
of software, I'd be much obliged. The current version was programmed
in 1990/08/14, so it's pretty old...(and the author does say there are
newer versions). This is a really good piece of software (although the
interface is a little cumbersome...not complaining though!) and I'd
really like a new/better version (especially with a printing function and
a bigger dictionary!! :^)

Also, is there any software out there that allows display of JIS codes?
You know, something like Kterm (on the unix) ? I'd like to be able to
input a JIS file into the thing and have it output on the screen with the
proper kana/kanji.

Any help in either of the above is appreciated. Thanks.

Vaya con Dios,
AcEzE.

622. New Falcon Blues

Newsgroup: comp.sys.atari.st
Date: 1993-06-14 23:10:12 UTC
From: jeff@jupiter.ame.arizona.edu
Message-ID: <1993Jun14.161015.4631@arizona.edu>
Source record: 204698

I have owned a Falcon for a few weeks now and I would
greatly appreciate any advice/common experiences/
sympathy from those of you fortunate enough to also
have Falcon's to play with. I realize some of my
questions have been touched on in other articles, but
I could use some detail.

COMPATIBILITY: NONE
Well, OK, my "semi-professional" GEM using
programs work in some modes, but I have not found
a single game or demo that works. Let me know if
anyone has found a way to increase compatibility.

MONITOR SUPPORT:
My SVGA monitor works, but I am desparate to get
another monitor to work because graphics look better,
sound exists, and (drool) 640x400 with overscan in true
color exists on other monitors.
Others have claimed flawless TV viewing. I get
a flawless picture underneath flying patterns of dots,
even though I've removed all possible sources of interference.

But I really want to use my SM1224 color monitor. I
don't know of anyone who has gotten this to work - mine looks
good bu the screen is uncontrollably flipping vertically at
about 20 Hz. Also, none of the written for VGA demos seem to
work in the overscan modes.

RESOLUTION: Any info on the bits I've been hearing about gaining
access to "unofficial" resolutions?

SOUND: Mine is intermittent at best, and there is a high degree
of noise on the headphone out jack.

LAST COMMENT - HAS anyone heard a word about GFA coming out with
a Falcon Version? Does anyone even know how to find GFA at the
moment?

I could go on with my new-owner blues, but I've cluttered your
window too much already. Thanks a lot for any Falcon-specific
info you can mail me.

I will say as a final comment for the rumor mills that I have not
perceived either Multitos, or SVGA/TRUEcolor modes to be slow.
Running a single program in a multitos window shows no apparent
decrease in speed. Blitting in 8-bit mode has that annoying
color flash that TT-owners are used to, and large true-color

BLITS show a ripple, but I've been animating sprite size objects
in the highest modes with no speed trouble.
(I am curious why a blitter that could blit 1.6 Meg/sec at 8 MHz
is only yielding 2.7 Meg/sec at 16 MHz.)

Thanx Again!

From an Atari loyalist of fifteen years and counting.

> Parker Mann xepama@usbk03.bk5001.chevron.com
> Chevron Petroleum Technology Company, Bakersfield, CA.

"Simple" is relative. I have small routines I always include in my programs which do these effects, but I don't have them with me (If you want code, let me know, and I'd be happy to send you some short subroutines (<5 lines).

The core concept of a sprite moving over a background is "masking"
Let's say you draw a note on the screen and save it in a string.
Ex. GET 0,0,15,15,note$ (You'd later want to load this from disk for speed)

Now, if you PUT this over a background (replace mode), you get a white square around the object.

If you PUT this over a background in OR mode (I think 7), this will work in a monchrome mode, but not in color. (If you're in monochrome, you can stop here)

In color, the bits containing color information of the background blend with your note sprite, so you must first "erase" ALL the background pixels behind visible note pixels. (BLITTING has no concept of color)
You need a mask sprite which has bits set to one for each pixel that you want the background to show through the sprite (i.e. color 15 in low res, color 3 in medium res, etc.) For your note, the mask sprite would look like a photo negative - 15's around the edges of the note, and zeros for the note itself. If the note is all black, you can create a mask just by PUTting the note sprite in NOT S mode, then getting it again.

Finally, always save the background in a string.

SAMPLE CODE:
(In a mouse-checking loop)
```
SPUT background$
PUT MOUSEX,MOUSEY,notemask$,3 ' AND mode "keeps" the background visible
```

```
PUT MOUSEX,MOUSEY,note$,7 ! OR mode again.
```

That's it. The hardest part is coming up with a masking sprite. You can do a quick mask by dropping a note and then FILLing around it by color 15 which works for some shapes.

It is also nic
e to take advantage of XBIOS 5 and flip between two screens in memory. This prevents flicker. Basically, draw the whole screen first on the "hidden screen" in memory, then flip screens (show the hidden screen).

I'm not sure what level of GFA programming you're at, so I'm not sure if this helps at all. Let me know if you would like a higher or lower level explanation, and I'd be happy to accomodate.

Happy Programming.

624. For sale again in the UK...

Hi,
(A continuing quest to sell Atari books and kit.)

A few items remain in my inventory that really do have to go!
How could anyone turn down a PC Speed board for an Atari STe for 20 pounds?

The books are as follows.
ST BASIC Source book and tutorial.
A Programmer's Guide to GEM - Sigma.
Atari ST 3D Graphics - Abacus.
Atari ST Machine Language - Abacus.
Introducing Atari ST Machine Code (Includes disk) - ZZSoft.
Fast Basic (manual + disk) - Computer Concepts.
The books and software are 5 pounds each or the lot for 25 pounds.

William.

In article <C8HMu2.JqH@sdf.lonestar.org> evanlang@sdf.lonestar.org (Evan Langlois) writes:
>The second problem is that many programs die a horrible death. MiNT tells me
>it encountered an illegal instruction, and I KNOW these programs don't have any
>illegal instructions. Could MiNT itself have gotten some non-68000 instruction
>in the compilation by mistake.

Did you define -DONLY030? If so, your version of MiNT won't work properly
on a 68000.
If not, what version of TOS do you have?

>t also couldn't find prgflags. The only one I have is a GEM version, where do
>I get a TOS version that accepts the same arguments that MiNT's makefile wants
>to send it (I just set the 2 TT flags and the fastload flag)?

It's not all that important: if you don't have a TT, only the fastload
flag will make any difference, and you can set that with the 'setfast'
program that comes with gcc. Or you can set the flags by hand, as you
did. (Indeed it is the 2 TT flags and fastload bit that are being set.)

>If anyone that knows is reading, like ERS, can I get bios device numbers for
>devices by using Fxattr on the files in the U:\dev\ directory?

No. Or at least, not for the purpose you're looking for, namely comparing
U:\DEV\AUX and U:\DEV\MODEM2, because those are very different devices.
AUX is an alias for "whatever handle -2 is pointing at", whereas
MODEM2 is a real BIOS device.

It is often possible to use Bconmap to find out where AUX is pointing
(assuming that it is pointing to a BIOS device and not to a file or pipe).
But are you sure you really need to know this particular information?

>OK, where can I get developer documentation for MiNT/MultiTOS.

Call Atari at +1 408 745 2000 and ask for developer support. If you're
not already a registered developer you'll have to become one.

> I didn't see an Flock in the manual pages, is this in
>MiNT, is it automatic, or it is a flag used in the Fopen mode??

Flock is essentially just another interface to the Fcntl file locking
operations which are described in the MiNT manual.

>Also, I wanted to use Dlock
>to lock serial ports by getting their device numbers as above.

Dlock works only on disk drives. Someday it will be possible to use
the Fcntl file locking mechanism on files in U:\DEV, but that doesn't

work yet.

Well, try the Programms Backward or Magi (both from France). They can switch
of the caches, emulate ST-Sound, switch the STE-Bus-Emulation on and more.
With these programms certainly 60% of my old ST-games are running.
You can find these programms on the most common ftp-sites for atari, for
example ftp.uni-kl.de or atari.archive.umich.edu (Backward is called
backwv13 or so...)

> But I really want to use my SM1224 color monitor. I
>don't know of anyone who has gotten this to work - mine looks
>good bu the screen is uncontrollably flipping vertically at
>about 20 Hz. Also, none of the written for VGA demos seem to
>work in the overscan modes.

Sorry, but you can't have both overscan and VGA. A good choice for the Falcon
is a Multiscan because of these cheap video-extenders called Screenblaster
or BlowUP030...
Please note: VGA and Multiscan (running in VGA-mode) have no Overscan and a
few demos will not run.

>SOUND: Mine is intermittent at best, and there is a high degree
>of noise on the headphone out jack.

Mine is not. It's not always the Falcon producing the noise...
Some amplifiers have troubles with the signal.

>LAST COMMENT - HAS anyone heard a word about GFA coming out with
>a Falcon Version? Does anyone even know how to find GFA at the
>moment?

GFA doesen't support the Atari-market any longer. BUT Richter (a german
distributer) has announced that the Basic 4.0 (full GFA compatible) is ready
in a few weeks (or months?).
A small (and dirty) hint for all GFA-Basic 3.5 owners with a falcon:
The programm runs in 320x200x16 (ST-Low), 640x200x4 (ST-Mid), 640x400 (ST-High)
and 640x480 (a wonder!). The shell is making troubles when you try to compile.
Now the trick: Start MENUEX.GFA in the Interpreter and compile your file!!!
With TOS 4.04 the GFA-Shell will work probably.

Ciao, Heiko.

>or something similar) instead of using the printer 300dpi fonts. This
>means of course that one has to have two sets of fonts on your hard
>disk.

This is the nature of TeX. Fonts are rasterised with MetaFont and stored
in raster form. Scaling rasters give poor results (ESPECIALLY at low
resolutions like 96dpi), so you should WANT to use MetaFont created
fonts at that resolution, not scaled 300dpi fonts. Of course, for zooming,
you need various fonts as well. The dvipreviewer I have (came with CS-TEX
mentioned in original followup) allows you to use whatever zooming you
like (from the command line).

Another point: I don't use 300dpi fonts... I use 360dpi fonts (bubblejet),
so see that the 96dpi screen fonts are even more essential!

637. Falcon + MIDI in => can't change screen mode!?!!??

Newsgroup: comp.sys.atari.st
Date: 1993-06-15 10:50:54 UTC
From: thumpy@dcs.qmw.ac.uk
Message-ID: <C8nssv.9r2@dcs.qmw.ac.uk>
Source record: 204511

Hi all.

Here's a strange one - I'd noticed recently that my Falcon seemed a bit fickle when changing screen mode from the desktop. Sometimes it worked fine, sometimes it bombed (2 or 3 usually). I finally managed to get round to a methodical bit of fault finding yesterday, and the results surprised me a little. Basically, the machine bombs when I change screen mode and there's something plugged into the MIDI in port. Odd - I think so. Bloody annoying - certainly. Anybody got any ideas as to how or why this might happen? The Falcon was bought at the beginning of March and has TOS 4.01. So far I've tried plugging in a Yamaha SY77, an Akai S3000, an Alesis drum box and a tape sync unit, all with the same results. MIDI out doesn't seem to cock things up, though.

While I'm on the subject of TOS, does anybody know what was fixed between 4.01 and 4.02? Just curious, and a little annoyed it didn't get including on my machine...

Cheers,

I have always plugged in MidiNet cables to the ST and everything works
fine. Are you sure it's not an accessory that can't cope with screen mode
changes that causes the problems?

(I have the TOS 4.01 Falcon, too).

"> ">does the Falcon really have to offer that hasn't existed in the PC and Mac world
"> ">for a couple of years?
"> "
"> "What besides graphics, sounds and a second CPU can a computer possibly
"> "have?!?!?

...How about easily obtainable memory?...I may be stepping into something here as I haven't touched Ataris for awhile (my ST is collecting dust at my parent's house) but isn't the Falcon still using non-SIMM memories?

I may have also been unclear previously. What I meant to ask is: What NEW technology (and with NEW I mean "not previously mass-marketed") does the Falcon have that would appeal to the GENERAL public (sorry, but a DSP doesn't mean much to the "average" Joe.) Actually, what does the Falcon have, PERIOD, that would appeal to the GENERAL public?

Of course, my definition of "average user" may not be yours, but I bet the majority of computer users out there run mainly spreadsheets and wordprocessors and the occasional (or not so occasional) game. If they want a new program, they want to be able to go to the store and buy it at a reasonable price. How does the Falcon compare to a cheap PC clone in fulfilling the above requirements? There's greater variety of spreadsheets, wordprocessors, and games for the PC market than there is for the Atari and, more importantly, they're easily available in any software shop (last time I checked, Babbages and Electronic Boutique in our area didn't even sell ATari ST software.) If the situation in Europe is much different, ignore the last two paragraphs :-)

Oh well, enough rambling on my part. They were just my $.01 worth anyway :-)

>a single game or demo that works. Let me know if
>anyone has found a way to increase compatibility.

Well written GEM should work in all modes - if it doesn't, then it may seem nasty but you should get a decent GEM referance & learn how to make it....

Get Backwards (available via FTP), this claims a 70% compatibility with ST games (I use it to run LLAMATRON on my Falcon (@16MHz, not 8MHz!!!).

>MONITOR SUPPORT:
> My SVGA monitor works, but I am desparate to get
>another monitor to work because graphics look better,
>sound exists, and (drool) 640x400 with overscan in true
>color exists on other monitors.

SVGA is great - a multiscan is better :)

> But I really want to use my SM1224 color monitor. I
>don't know of anyone who has gotten this to work - mine looks
>good bu the screen is uncontrollably flipping vertically at
>about 20 Hz. Also, none of the written for VGA demos seem to
>work in the overscan modes.

Yeah - thats bad programming on the part of the demos, the ATARI UK 'UKDEMOS' don't actually work on a UK spec. TV, you need a 60Hz scan TV to use them....

>RESOLUTION: Any info on the bits I've been hearing about gaining
>access to "unofficial" resolutions?

You should email Markus Gutsche (sorry if I've spelt it wrong Markus) for the PD high res driver (900*732*4bit) or wait for the commercial ones (eg. Blowup030) to become available. Haven't seen blowup, but Markus' FalconScreen (FS.PRG) is really good......and doesn't need extra hardware!!!

>SOUND: Mine is intermittent at best, and there is a high degree
>of noise on the headphone out jack.

Thats a fault on the board - many Falcons from the first batch (all?) develope this fault, send the machine back to your dealer, stamp your foot & demand a new one.

>LAST COMMENT - HAS anyone heard a word about GFA coming out with
>a Falcon Version? Does anyone even know how to find GFA at the
>moment?

GFA ceased supporting the Atari computers some 12 monthes ago......they switched
over to DOS & Unix (has anyone seen GFA Basic for Windows - WOW!!).

>I will say as a final comment for the rumor mills that I have not
>perceived either Multitos, or SVGA/TRUEcolor modes to be slow.

Snigger - how can you say that with a straight face.

>Running a single program in a multitos window shows no apparent

>color flash that TT-owners are used to, and large true-color
>BLITS show a ripple, but I've been animating sprite size objects
>in the highest modes with no speed trouble.

Actually, the blitter is automatically disabled in True colour mode 'coz
it doesn't work in that mode - the blit in 8-bit is just an inefficiently
written software blit.

>me know, and I'd be happy to send you some short subroutines (<5 lines).

>[Exploring the conecept of "sprites" with GET/PUT-commands]

>Happy Programming.

To create sprites there is a much easier way:
SPRITE note$,x&,y& ! puts the sprite note$ at location x&,y&
! if note$ has been displayed previously, the old
! image is deleted
SPRITE note$! erases sprite completely from screen

The format for note$ is very similar to that for defining a mouse pointer, except that mask and object data do not alternate, but come in blocks- I can look up the details, if you haven't got your handbook ready.
The only drawback is that you're confined to 16x16 pixel objects (in contrast to the GET/PUT-mode with no limitations) in two colors. The advantage is, you're relieved of the chore of resotring your background permanently.
Unfortunately you'll miss an easy way of controlling mouse-sprite-" collisions". There is no easy way with collision-registers like with the good old C= 64, so you'll have to check the co-ordinates, too.

Hope this helps. If there are any questions left, don't hesitate...

yours, Elmar

Well, a DSP will certainly not appeal to the average PC user, as they would actually have to go out and buy a DSP card. However, since every Falcon will have a DSP, then it will have relevance to the average Falcon user... any Falcon user in fact. Sure, DSP's aren't specific to the Falcon. That is not the point. The point is that every Falcon has a DSP, and any Falcon package that would benefit from using the DSP will be able to do so.

Hi,

I am very interested to know if Atari have any ATW Transputer workstations in their warehouses that they wish to sell off. I know of 4-5 fellow students who would give anything to get hold of one - as long as the price was right, we are all students so could not afford a huge amount ! Ie < cost 386SX plus Sension Transputer board.

Does anyone know if Atari do have any 'lying' around ! (Anyone from Atari UK reading this ?). If any Uni's or anyone is selling one, and the price is not to high please E-mail me !

I remember reading a lot about the ATW in ST World (the best UK Atari mag ever !) and seeing one at a PCW show in London a few years back.

Thanks for any help,

Rich.

>That will really help their TT and Falcon sales.

Boy are you cynical! al! At least they are advertising something! They need the Lynx to do reasonably well, so people will actually look at the Jag when it comes out. Even though they aren't connected, sales of the Lynx will affect the Jag. It's the ony reasonable explanation for why the GameBoy sells.

And, you might not like it, but the potential market for the Jag is much higher than for the Falcon, so Atari stands to make lots more money from it. (Remember they are going to make the profit from some of the games sold as well.)

And, in the end, advertising ANY Atari product brings the name back into recognition, which can transfer into increased sales of other Atari products.

Because, AFAIK *there* *is* *no* *PD* *version* of the ICD software. It's
copyrighted and only available to owners of ICD host adaptors.
If too many illegal copies get araound, this could well make ICD change their
policy of free updates, which would piss off lots of people (me, for example).

SO DON'T DO IT !

Bye,
Jens.

PS: Matthias, es gibt auch eine deutsche ICD-Niederlassung. Leider habe ich
die Telefonnummer der Mailbox nicht im Kopf (schick' bei Interesse eine
kurze Anfrage an Jens_Kilian@bb.maus.de).

Funny how our attitudes differ to the Germans over this. Fact is
you can download these utilities from (at least) one (cos I've done it!)
German archive (sorry, can't remember whether it was clausthal, berlin
or paderborn). This was quite recent and it was version 6. something I think.
Since they are virtually useless unless you have an ICD Host Adapter, I can't
really understand why ICD choose to make such a fuss about their public
domainness or not. Indeed it would be a service to Falcon/TT Upgraders if
they did make it "easy" for them to get these updates.

Not that the resulting files were of much use to me - for it seems
that, recent updates have almost entirely focussed on Falcon/TT compatibility
problems and this has resulted in larger long-winded executables that,
as far as I could tell, were no improvement over the original set I got
with my host adapter from the viewpoint of using them with a normal ST/STE.
For example, ICDBOOT is now much bigger and all that it does (for me!) that
my old one did not do is set the clock (I had to use another tiny program
to do that).

BUT, if you are one of those lucky ones who've upgraded to a Falcon
then of course it might be imperative to get these latest versions -
otherwise I'd say don't bother.

Remarkable how their COPYFIX.PRG TSR utility has grown over the
years from about 2k or so to (now) about 10k !! - but the original _was_
incompatible with many programs.

Cheers,
W. Alan B. Evans

Um, is there really so little news in the ST world that most of the discussion is about a mythical game machine that Atari claims to be developing?

Now that the Falcon is shipping, where are all the stories about how wonderful it is? Where is "all that wonderful software" that is supposed to be written for it?

Most of the Falcon related comments I have seen have been either:

1. I can't find one.
2. It broke mose of my software.

I live in Manhattan and I still haven't seen one in any computer store. Where are they. :)

Cheers,

Chris

OK, so each Falcon has a DSP. That means there are at least a few
hundred DSP's with Atari's logo floating about. Where do you go from
there?

I think that by the time that the average consumer is made aware of
the utility of a DSP, Apple will have already taken the market.
How many programs does Atari have that take advantage of this
lil' bit of hardware? How many companies are working on writing
or porting software to the platform? I suspect a handful, at best.

Cheers,

Chris

>evanlang@sdf.lonestar.org
I take it this is v0.55 minixfs. Try 0.60 pl2 on atari.archive as mfs602b1.zoo
(binaries only) or compile up 0.60 pl4. Be warned though these are pre-alpha.
Steve.

Someone suggested that to Bob Brodie in ATARINET and he said
it was an AWFUL idea, and I agree. Actually the suggestion
was to include it with new computers. First, its a product
that is no longer supported and does NOT work with newer
products (either ATARI or DOS products). ATARI would lose
money from people calling them and complaining or getting
their drives corrupted and who knows what else, plus it's
a product that shows that ATARI is lacking in some area.
What?? You need to a disk to run software an 8086 can run
simply because there is no ATARI equivalent?? What a laugh.

Don't get me wrong, I own PC_DITTO and have the original sales
receipt and all packaging, original disks, etc. I got it
for $10 from a guy that was selling some ATARI stuff (switching
to DOS).

The future is gonna be in doing this faster and more
effectively. I would think a cross-assembler would be in
order, something that would run multiple DOS programs in
windows and provide the OS calls for them in one program.
Such a program would be 3 stage.
1 - Convert program from 80x86 to 680x0.
2 - Optimize (GNU optimizer?)
3 - Load resulting code into a GEM windowing shell
to provide OS calls and multitask with the rest
of the system.

Who's gonna write it?? Well, I know 8086 code and I'm
learning assembly, but it will be years before I even look
into this any further. If someone wants to go for it,
lemme know and I'll give some more details on how I'd
approach the problem.

Whoops .. when I said "learning assembly" I meant 680x0. Sorry.`

How do you use back14wv.tos mine has no docs... (does not
decompress if is suppossed to).

I have a Falcon with TOS 4.04 US version.

Also, is there any way to edit the icons and make new ones.

Thanks in advance.

> Boy are you cynical! al! At least they are advertising something!
> They need the Lynx to do reasonably well, so people will actually look
> at the Jag when it comes out. Even though they aren't connected, sales
> of the Lynx will affect the Jag. It's the ony reasonable explanation
> for why the GameBoy sells.

The Lynx *is* doing reasonably well, in terms of market share; compared to their actual computers. They'll never really be a successful comapny until they start advertising. I don't know why the people at Atari don't understand this. They have very light advertising for their hand-help game machine, and *no* advertising (in the US, at least) for anything else they make. Sure, recognition of the Lynx may help Jaguar sales, if and when the Jag actually comes out. But most people I have talked to never even knew Atari *made* computers. They hear Atari and think of the Lynx (or more likely, of the 2600).

I'm sending follow-ups to *.advocacy, since this whole thread really belongs there.

This .sig is $hareware. If you use it for more than a
month, send me all of your money, then see a
psychologist. Or kill me.

True, but considering the Falcon 030 is, and always has been intended as an entry level consumer machine, it has all the expandability that any normal home user could want. Besides, what's wrong with being able to add 128 megabytes fast RAM, in addition to the 14 megs 16 bit RAM? As well, you can add a VME bus to an F030 which can accept a CyRel Sunrise graphics board which gives somewhere around 3000X2000 resolution with 24 bit colour (on screen) assuming that someone can find a monitor that can display it. I mean, what else would you want to expand the system to? MIDI ports?
The F030 is as expandable as it should be, considering the intended market.

After reading about ten of your posts I have come to the following
conclusions:

* You do have an Internet mailbox, but you're afraid to use
it.

* You have never seen a Falcon, and have no idea what it can
do.

* You don't know what a DSP can do.

* You fail to realise that while priced similarly, the A1200
is not half the machine the F030 is, if only for the DSP.
Not to mention the faster CPU, far superior sound, greater
expandability, and an O.S. that actually has true memory
protection.

* Lastly, you can't seem to grasp the idea that there is a far
better place to put all your posts -- comp.sys.atari.adv

667. spinning platters and stranger stuff...

Newsgroup: comp.sys.atari.st
Date: 1993-06-16 02:48:37 UTC
From: msteve@magnus.acs.ohio-state.edu
Message-ID: <1vm1m5$cml@charm.magnus.acs.ohio-state.edu>
Source record: 204542

Well sports fans, its the bottom of the ninth and the drive is ahead by a touchdown.... I bought a SF354 drive and it seems to be acting strange. Well, if I turn it on when the computer is off, the platter spins. It also spins when the A drive is accessed. I also have this nagging feeling that the drive also affects the other drive.
Case one: with the disk drive connected, When I tried to run Shadow of the Beast II, the A drive sounded like a machine gun caught in a garbage disposal. sorta tatatatatatatatatatatatatatat. (at this point I turn the computer off as fast as I can).
Case two: with the diskdrive off, the same occurance happens....
Case three: Disconnecting the drive from the 1040STf, I can run and play Beast II.

The second drive works fine, accesses disks, runs programs, lists directories. everything. But I don't think that the drive should be spinning when the computer is off, or that the second drive should affect the A drive...

Any help will be appreciated to the point that if you mail me a shoe I will kiss it and mail it back...

Message-ID: <1vm2dj$cmp@charm.magnus.acs.ohio-state.edu>
Source record: 204543

Not to be an alarmist, but my copy of Freeze dried just up and died. Some very strange occurances have caused the program to have erased alot of itself, mainly the configuration file.

Since this happened to a disk I bought only two months ago, I would think that the disk wouldn't be the problem. If it is, I better check the warrantee.

The disk worked fine till I saved the configuration file, exited the program, came back, ran the program and then exited without making any changes. Now I get disk space used in the 100 meg range (boy atari would definitely drool over my drive if it could do that) and some of the files have scrambled titles, something in what comes close to machine language and bad Klingon.

SO is there a bomb in FZD which would cause it to destroy itself, or should I blame my drive. Hopefully it is the program since I can easily replace that without any loss of funds...

This was the demo version, without a key, from atari archive in michigan, if th that helps.

Compute's: Atari ST: VDI
Atari ST: VDS
Atari ST: AES
ST Applications Guide: Programming in C
Learning C: Programming Graphics on the Amiga and Atari ST
Second book of Atari ST
Atari ST Application Programming (Datatech publications)

Why am I selling this?

I have invested quite a bit of hard earned money on the Atari ST, but
unfortunately I have not used much of the software/hardware and would
like to sell this as a package to an avid Atari ST entheusiast.

Please feel free to make any offer on a whole or part of the above described.

Price?

I will entertain all offers, my asking price is $600 for all.

WOW- $600 for an Atari system? I figure the hardware is worth about $200 and
the books/software $400. The books and software were purchased for over $2000
so I have quite an investment. I will split shipping costs.

Please Email to
address below: Thanks-

The latest ICD host software is also available on Genie. Look for it in the
ICD RT on page 120. While it still isn't free, it is probably cheaper
that way then calling ICDs BBS directly.

Questions about adding a second floppy disk on an ST...

It's normal for both disks to spin when accessing either one. Atari only implemented a single "motor on" line for both drives, so turning either one on will cause the other to spin too.

Not sure about the "drive spinning with the computer off" problem.. I leave my floppies turned on all the time, whether the ST is on or off. If you meant the drive spins briefly, then stops when it's turned on, that's probably normal.. if you mean it spins up and keeps spinning, that doesn't sound normal..

Problems with drives and games are fairly common, mostly due to sloppy programming or copy protection. Some games will forget to turn off the drive light or motor on line after the game has loaded, leaving the drive or light on while you play the game. I think Double Click had one of their "Program of the Week" utilities to turn the drive off. If you can find a combination of factors that lets you play the game (like unplugging the second drive), that may be the only way it'll work...

I for one will be doing my best to implement it wherever it will
yield any speed increase; that is as soon as I get my Falcon and Devpac3
upgrade! (I already have the 68030 programmers reference manual and
DSP56000/56001 Digital Signal Processor manual.) I am not a comercial
developer (maybe someday :) but if every programmer, no matter
how small utilizes at least part of the
DSP's potential in their programs, Falcon owners will see some very speedy
software (for a 16 Mhz 68030 based machine)
Also (I'm pretty sure someone pointed this out already..) the best

thing about the Falcons DSP is that it will be in EVERY machine. It is a seccond processor that works in PARALLEL with the CPU...

And remember...even though it was slow in comming, the Falcon is still THE FIRST PC to implement such an impressive assortment of features.

For those non believers, read that again!; the Falcon was FIRST!
Those DSP MACs are not even out yet!

A little company called Acorn brought one of these out six months ago, it
wasn't seen as a big thing it was just an implimentation of a new standard
which seemed to be alrady is use by other systems. Perhaps Atari are
developing one twice as fast as the twice as fast system?

>>
>> And how about a Virtual Reality set. Atari has not officially announced it,

>or porting software to the platform? I suspect a handful, at best.

The average user can't afford the Aplle computers with DSP. They are
at the top line of their product line $5000 and up.

There is A LOT of software using the DSP already: For music, for
graphics, for real time filtering in scientific application
- for alomst all the DSP
can be used for. The only thing that is really missing is the software
modem...

Source record: 204461

Just thought you might like to know that I phoned Atari about getting MTOS for my machine Falcon030 because the company I brought the machine from had gone bust and they were very helpful.

I was given the head office number and told to phone and get in touch with customer support. This I did and was told that I merely had to send a letter explaining this with my serial no. and proof of purchase (a copy only) and then i would get MTOS free when it is released in the UK.

If Atari stick by this I might be inclined to think they had *some* customer support at last!!!

Time will tell...

>market.
>

Actually it's a great way to *start* because of the overwhelming size
of the USA marketplace. (Can you perform saturation advertising of 200
million people on $1,000,000 when TV commercials are $50,000 per minute?
I know _I_ couldn't!) The plan is to pick an area, do well there, then
expand to another area. Do well again, expand again, etc. etc. until
you have the whole US as a market area.

I don't know why the Lynx effort failed after the first market ... maybe
there was a Weekly Mid Course Correction [tm] in which they decided that
advertising was too expensive or something.

If they do that again (i.e., marketing in one select area), maybe they
could start here in California and work towards the East. If anybody
who "works for Atari" (ersmith@netcom.com, maybe?) would be so kind to
show this to Sam Tramiel & tell him to mention it as a viable marketing
plan during the Atari Annual Meeting for Stockholders on the 25th
(that's this month, gang), he'll probably get a round of applause from
those of us in attendance! Just for admitting to having a marketing plan!
(Imagine that! A marketing plan!)

The cheapest dsp mac will start at $2300 with a 25mhz 040. This pup will have dual dsp's for sound and video, digital video and video in and out....
This centris 660 av will blow the Falcon away.

By the way the Centris 610 is selling at $1299 now and is shipping and selling in quantities and will be upgradeable to the Centris 660 av.

>touchdown.... I bought a SF354 drive and it seems to be acting strange. Well,
>if I turn it on when the computer is off, the platter spins. It also spins
>when the A drive is accessed. I also have this nagging feeling that the drive

This is normal. The drive spins when A: is accessed because there is
only one "motor on" line for both drives.

My external drive also spins when the computer is off. I've always
made the following assumption (though I've never looked at any
schematics or done any testing to verify it, it's a plausible theory):
The motor-on line has two states, and when the machine is off the line
floats to the on-state (either by going to 0 voltage, or by "floating"
to high, depending on which one is the on state). I've seen external
drives that don't spin when the machine is off, so maybe Atari added a
resistor in later models to fix this. In any case I wouldn't worry
about it.

>also affects the other drive.
>Case one: with the disk drive connected, When I tried to run Shadow of the
>Beast II, the A drive sounded like a machine gun caught in a garbage disposal.
>sorta tatatatatatatatatatatatatatat. (at this point I turn the computer off
>as fast as I can).
>Case two: with the diskdrive off, the same occurance happens....
>Case three: Disconnecting the drive from the 1040STf, I can run and play Beast
>II.
>

Now that doesn't sound right...my internal drive has always been loud,
but not THAT loud. Does the same thing happen with other programs, or
just this one game?

Cheers,
entropy

The only thing that the Falcon is superior is its sound. The A1200 has a superior OS, graphics and is alot more and easier to expand. And there is more hardware development on the A1200 than there is on the Falcon. A two meg A1200 starts at $399. C= has sold over 300,000 A1200 since it was released back in December and it hasn't approached its first anniversary yet. I think Atari has only produced 10,000 Falcons as of today..

703. Re: Falcon marketing strategey

Newsgroup: comp.sys.atari.st
Date: 1993-06-17 05:10:43 UTC
From: Bob_BobR_Retelle@cup.portal.com
Message-ID: <83528@cup.portal.com>
Source record: 204413

The Falcon marketing policy does indeed require having a storefront operation to be able to sell Falcons, but it goes beyond that to "protected" regions..

A dealer CAN send a Falcon through the mail, but ONLY to someone in his local area.. they can't send Falcons to anyone who lives in a different dealer's local area.

This is to protect the dealers from unfair competition from dealers in other areas.

Unfortunately, as the example quoted shows, if your "local" dealer doesn't have Falcons, you're screwed.

(I dunno if Atari is taking mail-orders for Falcons for people in areas which don't have dealers, or if they'd ship to an area which at least on paper is supposed to have a dealer... it might be worth a call to Atari to find out...)

Correction : SOME Atari owners care, and I am not one of them. If we were interested in buying a Mac we could find out about it in lots of other places. Please notice the followup to comp.sys.atari.advocacy where this thread is more appropriate.

Oh PLEASE, lay off with the attitude already. It's pretty hard not to
accept the reality that Apple is beating the pants off Atari in terms of
sales. Just because someone doesn't like the situation doesn't mean they
don't understand it. Obviously we've accepted the problems with Atari
and/or decided not to worry about it anymore, otherwise we'd be long gone
from this group.

707. atari archive UUencoding

Newsgroup: comp.sys.atari.st
Date: 1993-06-17 09:07:00 UTC
From: Steve.Yelvington@f47.n282.z1.tdkt.kksys.com
Message-ID: <740407671.AA06219@tdkt.kksys.com>
Source record: 204449

(Gijs Bok writes of problems with BART's uuencoding.)

When I created UUCODER, I had to modify the decoding routines (which are lifted from a modified version of the Dumas UUD program) to accommodate some strange habits of BART's uuencoder.
It's possible that BART has cooked up some new strange habits that UUCODER doesn't know about. I haven't ordered any files from BART in quite awhile, since my ST's hard drive is dead and thelake.mn.org is off the air.

>Can't accept the reality....

It's got absolutely nothing to do with not being able to "accept the reality." I can't afford to buy a Falcon or anything else right now. I couldn't care less about how the A1200 stacks up against the Falcon, nor do I care how Apple's lineup compares to anything else. My point is that your posts are 100% out of place here. They belong in exactly one place, and that place is comp.sys.atari.advocacy, NOT comp.sys.atari.st. If you want to be taken seriously, then start posting responsibly, in a newsgroup that's appropriate to what you've got to say.

Note the "followup-to" comp.sys.atari.advocacy...

717. Atari in Norway :-(

Newsgroup: comp.sys.atari.st
Date: 1993-06-17 13:45:27 UTC
From: oesterud@nki.no
Message-ID: <9306171341.AA16366@nki.no>
Source record: 204490

I'm not sure if this will ever reach comp.sys.atari.st but I'll try.
My e-mail site does not distribute com.sys.atari.st so if someone
would send me a copy of the replies it would be very nice....

I'm living in Norway, and was a developer with Atari Scandivia, but
suddely they moved out completly and closed their offices in Norway
and Sweden, and now almost no one has or will buy Atari computers
(ok, some dealers still can get it, but everybody is buying Amigaes
instead - you can get more software and more friends with that one)

Does anyone know what Atari will do in Norway and Sweden ?
Will they set up some kind of new distribution ?
What about some campain to sell more Atari's ?
Or should I just get rid of my Atari ?

718. Mint .99 & 1.04

Newsgroup: comp.sys.atari.st
Date: 1993-06-17 14:23:29 UTC
From: lemmens@dutind5.twi.tudelft.nl
Message-ID: <1993Jun17.142329.24708@donau.et.tudelft.nl>
Source record: 204497

1)
I have tried to compile 1.04 and 0.99 with both GCC and PURE_c. All versions work, but they use almost 500 kbyte more memory than my 'old' mint 0.96 !! Does anybody know how this is possible and what I can do about it ? (I use a MEGA STE 4)

2)
When using MINT 1.04, a press on <ESC> to force a reread of the current disk is enough to make the whole system hang with an ILLEGAL INSTRUCTION. However, this doesn't happen under MINT 0.99 (and 0.96). Anybody experienced the same problem and knows how to fix it ?

3)
I'm using the last available version of TOSWIN. However, the memu to determine if you want "PASTE" to add LF's and/or CR doesn't work well. As soon as you pick one of the buttons you'll
find the menu garbaged when you try to enter it again.
Also, when you are using .mnu files and pulldownmenu's in TOSwindows, the system hangs when your
moving several times with the mouse pointer over the menu items.
Anybody knows a workaround ?

719. remote login facilities

Newsgroup: comp.sys.atari.st
Date: 1993-06-17 14:33:43 UTC
From: lemmens@dutind5.twi.tudelft.nl
Message-ID: <1993Jun17.143343.25050@donau.et.tudelft.nl>
Source record: 204498

I posted a new version of my remote login facilities package st_login.lzh on atari.archive.

New features:

- A split window TALK facilitity to talk with another user logged in on your atari. It uses TERMCAP, so it can also use an XTERM, VT100 or whatever terminal you're using to do a remote
login.
- A REBOOT command to reboot your system while logged in over a remote line. This one also broadcasts to other users that the system will be going down at regular inervals. (ie UNIX)
- The GETTY process that permits you to log in over one of the serial ports (either through a hardwired terminal or a modemline) can also work now on a normal ATARI without MINT, although then it cannot run in the background !

I was trying to locate the recent copy of Sozobon C (Ian Lapore's Heat & Serve version) on an anonymous site. I could not get into atari.archive. So instead searched at src.doc.ic.ac.uk (in computing/systems/atari/umich/Languages directory. The index says it is there, but the file is not there. Then I tried the other mirror (of atari.archive) in USA (can not remember the site name) and the same thing happening there. Does anyone know what's happening ? Is Heat & Serve C withdrawn or what ?

Correct me if I am wrong but the expansion bus needs to be connected to
something, not exactly a standard feature. Unlike the DSP which is there.
For your information, the Falcon is selling quite well in the UK, Cuabse
Audio is about to be released and everyone is VERY interested.

Huh? I didn't even know they made modems. And most host adapters
really don't *care* what transfer protocols you use.

This .sig is $hareware. If you use it for more than a
month, send me all of your money, then see a
psychologist. Or kill me.

^^^^^^^^^^^^^^^^^^^^^^^^

I bet that this poor ass**le is just frustrated like hell 'cause he once
bought an Atari without knowing what he was buying... maybe he could not
find all games for Atari he could find for the amiga, hee, hee.
Or maybe he is trying to save us from his Devil: Atari?
I don't know you, but I am tired of reading Mac and pc prices in this group.
I know why I like Ataris and Atari Users and just hope we reach the peace
with ourselves and our STs, like the ol' Atari XL users have managed long
ago... there is no point in wondering if there is a better machine than yours
out there, there is ALWAYS a better machine...
HINT: Try to use your machine to the FULLEST! I still get amazed when I see
the new demos and programms for the XL, when I had one (12-13 years ago?)
those things where thought as impossible in such machine.
sinclap2954 (or whatever its name may be) is the typical chip consumist...
he is not constructive about what a machine CAN do, he needs to show another
machine can do better, and he needs to OWN that machine...this he calls
reality... indeed, a very poor reality he has built for himself.

YES, GO! AND BUY YOURSELF A CENTRIS!!
AND A PENTIUM PC, AND A SUN WORKSTATION, W_H_A_T_E_V_E_R YOU WANT!!!

BUT LET THIS GROUP BE!

READ IT?????
UNDERSTOOD IT??????

ok, now I calm down...

It sounds like your ICD.SYS file got trashed or it no longer
exists. You need to run the HDUTILTY.PRG and create a new
ICD.SYS. This program will present you with options for booting,
wither from floppy or the C drive itself. This should work for
you. After finishing the program, you will have to reboot your
ST. Hope this helps.

Sorry to bring the bad news, but Atari DOES mean no mail order of Falcons.
It is permitted to buy a Falcon at a store in person, and then it can be mailed
to you. Take it from a guy who was left no alternative than to drive over 500
miles merely to buy a Falcon.
This is why stores which are mail order only are not allowed to sell
Falcons.
I must give credit to the ethics of the Atari Dealer community. Not
one of them would accept any form of bribe to sell their own product.

And of course, this all applies only to Atari hardware, nothing else.
(You can mail order any software or third party hardware.)

But remember, this is in all our best interests!
See Ya!

> present).

With some further experimentation, I've found that putting McMinos on a floppy, with the little program (128 bytes) TREKFIX.PRG in the AUTO folder, and booting from the floppy, allows McMinos to run on my Mega 4 (TOS 1.02).

I've not yet had a chance to try McMinos (in any form) on my Mega STE (TOS 2.05), but will try to do that tomorrow.

TREKFIX.PRG, in uuencoded form, is appended to this message.

I'm screwed then. There haven't been any dealers around here for a long time.
This sounds pretty fu**ed to me. I understand the reasoning, but since dealers
are scarce, it means the buyers have to pretty hot about the Falcon. In
addition to paying an outrageous price for the hardware, now I gotta go do a
road trip, too? %$#@^&*

>>case with the DSP56001, when using the external RAM.

>Njet. The 96 KB of DSP RAM in the Falcon are zero wait, 25ns SRAM.

With respect, my original post is correct, if not particularly clear. The
56001 can only do ONE access per cycle to external RAM without introducing
a wait state. So, if the program is in external P-ram, then you cannot
access external X or Y ram without wait-states. If you access both then you
will introduce two wait states.

In short, it may be zero wait-state RAM, but that doesn't mean that you
never have wait states, only that you can do one external access per cycle
without introducing one.

749. Redirecting printer -> MIDI

Newsgroup: comp.sys.atari.st
Date: 1993-06-18 12:40:48 UTC
From: michaeld@stack.urc.tue.nl
Message-ID: <1vsd4g$4a4@tuegate.tue.nl>
Source record: 204428

Hi,

I recently bought a 1040STe + monitor (for $110) just to run Cubase. If I
want to print something, I have to disconnect it from my amiga, and then
connect it to the ST. Of course I can buy a switchbox and an extra cable,
but this may cost more than I want to pay. Since I have a MIDI-interface
on my amiga, it would be nice to connect the two and then redirect the
printeroutput to the MIDI-port and then my amiga can send it to the
printer. Is there someone out there that can make such a program ?
The only problem is that it should run under Cubase, which (I think)
does some strange things with the OS.

MDB

PS: I really don't know a thing about ST's , I only bought it to
make some music.

> 2.05), but will try to do that tomorrow.

Just a quick follow up: the internal hard drive on my MSTE isn't working,
so I just tried running McMinos from a floppy (no trekfix involved) and it
seems to be working just fine.

758. ICD SCSI tape driver

Newsgroup: comp.sys.atari.st
Date: 1993-06-18 15:42:52 UTC
From: j.d.coleman@newcastle.ac.uk
Message-ID: <C8tqBG.A68@newcastle.ac.uk>
Source record: 204439

I mailed ICD, Inc on Compuserv recently regarding their SCSI tape driver. I have just received this reply :

> No. Our Tape software is designed specifically for the TEAC MT-2ST/N50 drive.
>
> IF you aquire one of those drives, we do sell our software for $99 US.
>
> - TOM -

It looks like the only commercial SCSI tape software is that available from Beckemeyer. I don't know if anyone in the UK sells this.

Source record: 204440
Cross-posted to: comp.sys.atari.st,comp.sys.amiga.games

I recently bought lemmings for the ST. The game is great. However, it causes the floppy drive to spin constantly while playing, even when the drive is not being accessed (it spins even when the drive busy light is off). Does anyone else who owns lemmings experience this??? Is there a way to make the drive not spin in-between accesses??? Will it damage the drive or disk to constantly spin???

Also, I was unsuccessful in my attempt to backup my disks with F-Copy III (I assume the disk copy protection prevents copying). I would like to have a backup, as the game is not cheap. Is there a PD, shareware, or commercial program that will allow me to make a backup of this game??? (No, I will not be giving away a copy of the game when I back it up. All of the St users in my area are definitely AGAINST piracy.) I would just like to protect myself in case of an accident.

Post replies here or E-Mail directly to me.

Larry Richardson

762. For Sale: Various Atari extras

Newsgroup: comp.sys.atari.st
Date: 1993-06-18 17:35:54 UTC
From: ewels@vax.oxford.ac.uk
Message-ID: <1993Jun18.173554.14811@vax.oxford.ac.uk>
Source record: 204441

Hello,

I hope this is the right place to post this, apologies if 'for sale's don't normally appear here.

I have several Atari add-ons for sale, originally used on the mega ST2, but I think they should all work with smaller machines. These include the SLM804 Laser Printer, A3 Graphics Tablet, Stereo-Tek 3-D glasses, B&W Panasonic Video camera with all necessary interfaces, and loads of software, mostly business orientated such as DTPs, art-packages, languages, clip-art, etc. I'm now trying to sell this as my main ST with monitor and hard drive was stolen and I don't intend to replace it.

Any reasonable offers will be considered; I'd rather sell the whole lot together but will consider splitting if required. Either contact me at the e-mail address above or telephone (0865 742065) (England), or from July onwards, (0743 821 694).

Thanks very much!

- Chris Ewels

763. Atari Stock Price Steady

At mid-day today, Atari was trading at 2 3/8 unchanged, while Commodore (CBU, right?) has dropped 1/4 to 2 3/4. Since Atari seems to be holding steady while Commodore continues to drop, which company retains a higher level of investor confidence?

(Hint for those non-Atarians visiting from the .advocacy newsgroup: the answer starts with an 'A' and does *not* have an 'm' in it).

>version 6.06 of the PD ICD_Utilities (as opposed to their Professional
>version that runs without a Host Adapter).

There's no such thing as the "PD ICD utilities". All of the ICD
utilities are copyrighted. Even the non-Pro versions.

Please be careful about this kind of terminology -- if I worked for
ICD I'd be really annoyed to see people calling copyrighted software
I'd written PD just because it's distributed freely through Genie and
the ICD BBS.

If the paderborn archive folks accientally posted a copy of the ICD
utils on their system, you should be discussing it with them in
private email, not in a public newsgroup. Mistakes happen, and I'm
sure that if it hasn't been corrected they'll be happy to do so (since
they've said as much in this newsgroup). Posting this sort of
information here is bad because some people may see your message and
grab a copy from the server before it's removed.

Cheers,
entropy

I was told by Bob Brodie that even though Atari doesn't publicize the
fact that they will sell you a Falcon030 directly, they will do so.

This means if you REALLY want a Falcon030, you can order one direct from
Atari Corporation.

>are scarce, it means the buyers have to pretty hot about the Falcon. In
>addition to paying an outrageous price for the hardware, now I gotta go do a
>road trip, too? %$#@^&*

Calm down... if there isn't a dealer near you, you are allowed to order
one from the next closes dealers to you.

This means that if there are NO Atari dealers near you and the next closest
dealers are 100 miles away, you can order it from one of them. All they
have to do is ask Atari for permission to sell it to you. Atari then records
where you are located so they can concentrate on getting some Atari dealers
near you.

>

I personally think the "no mail-order" policy is a good idea. But, you and
everyone is right, Atari needs to get more dealers.

I think Bob said that there were 120 dealers in the U.S. I'll be happy
when there are 500.

From: whitcomb@aur.alcatel.com
Message-ID: <63395@aurs01.UUCP>
Source record: 204306

I just bought the Bitmap Brother's new game The Chaos Engine.
Unfortunately, it won't load on my Mega ST4. I have TOS V1.4, and an
AdSpeed accellerator (which boots at 8 Meg). Color monitor, of course.
I even disconnected all of my peripheral cables, but no go. I have
several other Bitmap Brother's games that all load fine (Gods, Speedball
2, Magic Pockets, Cadaver).

The frustrating part is that the game loads fine on the 520STFM that I
just sold, so there doesn't seem to be anything wrong with the disk
itself. Seems like there's some sort of copy protection that won't pass
on my Mega.

Anyone have any suggestions?

Source record: 204450

I've just sent Minixfs pl4.1 source to ftp.uni-muenster.de . pl5 was to be
the next version but a few bugs werer reported which needed fixing quickly.
The main fixes are:
1. Large partitions with non XHDI software should now work (though untested).
2. Filesystems with 65535 inodes should also work (somewhat more tested).
You still need to switch the cache off if yo use ICD software due
to a bug in all the versions I have seen: not my fault, complain to ICD ...
Steve.
P.S. It may also be on atari.archive if I can 'get in'.

774. mail order restrictions

Newsgroup: comp.sys.atari.st

Want to know why I have refused to complete a dealer application for FALCONs. The agreement says that Atari, at its diescretion, can permit mail order or refuse permission for a dealer.

Scenario, I become a FALCON dealer and cannot sell mail order. I have a large inventory. Then Atari gives my competetor (e.g. TOAD) the right to sell mail order and the competetor undercuts me. End result; take a bath on the FALCONs in stock.

The rule should be NO MAIL ORDER or MAIL ORDER PERMITTED. It should not be SOME may and SOME may not!

Quite simply, the marketing strategy is BAD. A dealer that is not in the good books with Atari (i.e. one that complains about poor Atari service) is at the mercy of Atari. I'd rather be at the mercy of my ex-wife.

775. Re: STalker/STeno/STill

Source record: 204303

Dear Folks:

Put this up, got lots of great responses, including a few from Eric Rosenquist, author of these two great programs, but danged if we ever solved the problem--in brief:

When I transfer text from STeno 2.0 via the clipboard (CPXed w/ that German CPX version to my ramdisk, CodeRam), the TAB characters, apparently not translated into spaces, turn into backspaces on our IBM AIX system running PICO. Results--HAVOC! I can save a STeno text file to disk (including, as usually, the ramdisk) and shoot it through STalker with no problems, but I still feel as if I've got a crippled eagle, here--I'd like to save the extra step, or use the "Type Ahead" feature from time to time. Eric thought the problem might be my modem, but with the Ted editor (also on our system), this doesn't happen, and the modem tests I ran seem to vindicate the thing. Theories, anyone?

Rob S. Rice, U. of Penn.
Where ENIAC is still appreciated

I'd appreciate any solution. If you're ducking up to 714 today, I could be here except from about 1:15 to 2:45, when I go over to the pool and try to drown myself. It feels as if I'm succeeding.

Rob S. Rice

776. Calamus Import TABS Problem - Can anyone help?

Newsgroup: comp.sys.atari.st
Date: 1993-06-18 20:45:39 UTC
From: wabe@ukc.ac.uk
Message-ID: <4953@eagle.ukc.ac.uk>
Source record: 204301

Of late I had the problem of getting a text file (with TABbed output so that I could make columns) into the Calamus (v_1.09) that I have. The problem is that Calamus (on ASCI input) will insist on converting TABS to spaces - although, once a TAB gets inside, Calamus understands what to do with it.

I solved this problem by a _very_ long-winded procedure i.e. import the file as ASCI into Calamus - then save it as a .CTX (Calamus text file) - then go into a hexadecimal editor (I used XXED.PRG) and copy its header - then append to this the "original" text file with TABS - save as a .CTX file - and then import this into Calamus. The TABS then go in OK although you dont get ALL the file being inputted (I solved that one by inputting TWO concatenated copies of the same ASCI file and trimming off the excess!!). What a palaver!! - needing hexadecimal editors etc. etc.!!! If only SIGNUM2 could print in the Landscape mode on my SLM605......

SURELY, there's a more elegant way of doing this, but my manual is useless on this problem and I fear that Halco (Sunbury) - the official UK importers - will be as useless as ever if I bother contacting them (again). If anyone out there has met this one AND SOLVED IT - PLEASE let me know.

Thanks in advance,
W. Alan B. Evans.

>my ex-wife.
>

I believe that no one will be allowed to sell mail-order EXCEPT if there
are no dealers in a certain area.

This is why Atari will sometimes allow dealers to mail-order.

If Atari gave TOAD or someone else permission and no one else, you could
bitch about it. And if nothing is done, sell off the rest of the Falcon030s
and stop carrying Atari products.

>>
>[...]
>
>No, it was not Paderborn. We don't have ICDUTILS on our server!
>
>Cheers, Thomas.
>ts@uni-paderborn.de

As it happens, I _STILL had saved the INDEX and it _WAS_ paderborn
that I downloaded the PD ICD utilities from some while ago. Here is a tiny
part of _YOUR_ old INDEX

```
!
!Wir geben jedem Atari-User die Moeglichkeit, PD- und SHAREWARE-Software einzu-
!
!-----------------------------------------------------------------------------
!Anregungen sind wie immer gerne willkommen! Mail: stsoft@uni-paderborn.de
!
!
!./tools/hd/ahdi5.zoo ;AHDI Version 5.0, offizieller Atari HD-Treiber
!./tools/hd/backupst.zoo ;Backup-Utility
!./tools/hd/chkhd83.tos ;Festplatten Test-Programm
!./tools/hd/hdscan
!*** ./tools/hd/icd_606.lzh ;ICD Treiber-Software V6.06
!./tools/hd/sam.lzh ;SAM repariert Festplatten
!./tools/hd/sback481.lzh ;HD-Backupprogramm
!
```

True, it wasn't called ICDUTILS but "icd_606.lzh" - but it IS
version 6.06 of the PD ICD_Utilities (as opposed to their Professional
version that runs without a Host Adapter).

Get to know what's in your archive man!

W. Alan B. Evans.

It's a known bug in tosfs.c - the media change code is broken; simply add
one line to tos_dskchng():

```
ti->name = 0;
nextf = ti->open;
+ if ( (ti->attr & FA_DIR)==0 ) /* NOT a subdirectory */
while ( (f = nextf) != 0 ) {
nextf = f->next;
f->next = 0;
}
ti->open = 0;
/* if there are any cookies pointing at this name, they're not
* valid any more, so we will *want* to get an error if they're
* used.
*/
```

>I need to know soon so tell me as much as possible ASAP! Thanks.

I had Midwinter II and it could have been a great game.
Unfortunately, the disk accesses killed it completely as far as
playability went. It would take 2+ minutes to load a screen telling you
you had defeated a squad. As this could happen once every 2 or 3 minutes
in a heated battle, this was fairly frustrating.

I personally haven't played it but my brother has both I & II and thought that II was pretty good but it was a pain to play if you didn't have a hard drive as it was constantly accessing the floppy and asking for another disk.

785. Atari stuff for sale

Newsgroup: comp.sys.atari.st
Date: 1993-06-18 23:59:42 UTC
From: eggert@sun.lclark.edu
Message-ID: <1993Jun18.235942.12854@lclark.edu>
Source record: 204312
Cross-posted to: comp.sys.atari.st,pdx.forsale,or.forsale,pnw.forsale

I still have the following items for sale: $270 Takes all.

Atari 1040 STf -
1 meg RAM
with Atari mouse
Atari SC1224 -
Screen bows at top and bottom. This is
apparently due to a burned out capacitor.
Should be an easy fix.
VideoKey -
Use a TV or VCR with your ST.
Works great!
Monitor Master -
Switch monitors without unplugging
and plugging.

Software -
Laser C compiler
Laser C Debugger package
Quantum Paint
BBS Express! ST
Falcon Flight Simulator
Bloodwych
Chrono Quest
Carrier Command
Gone Fishin'

Again, all of this could be had for $270 buyer pays shipping. I will ship c.o.d. if desired, but I ask that the buyer pays for that ahead of time (I got royally screwed on a previous deal that ALL of this was supposed to go with).

entropy@gnu.ai.mit.edu (maximum entropy) writes:

>There's no such thing as the "PD ICD utilities". All of the ICD
>utilities are copyrighted. Even the non-Pro versions.

One thing all this seems to point to is that whatever company is
distributing ICD product in Europe is obviously not supporting the
product as well as ICD does here. I know if my only recourse for an
update was to phone Germany to download it from a bbs, I'd be rather
upset.
Has anyone from Germany tried getting in touch with ICD and
complaining about the lack of availability of updates to their software
in Europe? Maybe they could confince their European distributer to set
up a bbs locally to distribute updates.
Their whole position on their drivers makes little sense to me.
The drivers (the non-pro ones) don't run on anything but an ICD host
adapter unless patched anyway, and anyone with access to the patched
drivers is hardly going to be bothered with copyrite issues.

>>

>I personally think the "no mail-order" policy is a good idea. But, you and
>everyone is right, Atari needs to get more dealers.

I still think the no mail order policy is the delusion of someone who
had a bit too much sun. Take Atari out of the picture, and whatever
manufacture you have left, I bet most sales come from mail order.

Yea, I understand why it was done, but there had to be a better way
than this.

Myself, I got lucky, and called a dealer only a couple hunderd miles away
from me, and was able to reserve a machine from the next shipment in about
a week. I dont mind making the drive there, since Ive a good friend in
the general area who I can stop by and see...

Now if Atari could work out a deal with a large chain store, say for
instance K-Mart or some such, or even Sears, this would be perfect...

795. Re: spinning platters and stranger stuff...

Newsgroup: comp.sys.atari.st
Date: 1993-06-19 06:19:15 UTC
From: msteve@magnus.acs.ohio-state.edu
Message-ID: <1vub53$ie2@charm.magnus.acs.ohio-state.edu>
Source record: 204322

This is MY terminology for when an unreadable disk is stuck in my drive. The only other time This happened to me was when I put a failing disk in the drive. This isn't a regular occurance, but when heard, it means serious trouble. Every time I hear it, I believe my drive gets worse... I may be paranoid, but I am at least paranoid for my own good. Can anyone explain this any better or can word the analogy better, so that it doesn't sound as drastic.

The Sequel

>can word the analogy better, so that it doesn't sound as drastic.
>
> The Sequel

The above was in response of the question of the sound of my disk drive. I had described it as sounding like a "machine gun caught in a garbage disposal" Though I know what a garbage disposal AND a Machine gun sound sepaprately, I never really have or have heard anyone else listening to one caught inside another (it is 2:am in the morning bear with me...).

~^I erased too much, so this explanation was needed...

The Sequel ...again

From: evanlang@sdf.lonestar.org
Message-ID: <C8v1Fw.9yJ@sdf.lonestar.org>
Source record: 204349

I've had alot of problems with MiNT giving me illegal instruction errors too. I think some assembly in there has an 030 instruction or something like that. The TOSWIN 1.4 always goes black when you tell it to add nothing to the end of a line. I want it to insert CRs when wherever they are in the original so that if I mark 3 lines, there is a CR after each full line, and if I mark 1/2 a line, there is NO CR because it's no at the end of a line. However, I can't find a way to do that.

Right now I'm using .95 and I may try 1.04 again soon, but I'm likely gonna wait for 1.05 :-)

800. Error -39, 0 bytes, ST Problem

Newsgroup: comp.sys.atari.st
Date: 1993-06-19 08:52:02 UTC
From: kosmatoo@JSP.UMontreal.CA
Message-ID: <1993Jun19.085202.22306@cc.umontreal.ca>
Source record: 204324

Can some ST guru help me with this weird problem on a friend's 1meg 520ST?

The problem: After booting up the ST, and a random amount of
time (up to a day at most) passes, the ST gives
an "out of memory" error (TOS #-39), and quits
the program running, goes back to the desktop,
and in the window with the contents of DRIVE A:
it says "0 bytes used in 0 items"

Why the big deal: It only does this with some programs.
Yet, these programs are known to work
fine on other machines.

Notes: no viruses on disk. Memory tester passed. No accessories installed,
no auto folder programs. No ramdisk. Not a drive problem.

The computer works fine for a while, then messes up.

My thoughts: perhaps its simply a matter of chip connections in their sockets
but dropping the thing didn't help. (standard 520ST trick)

What can it be? This once happened to me on my own 520ST but I can't
remember what I did to fix it. Is it the DMA chip that's messed up?
Is it the WD1772 chip? Is it only software? Any ideas? Help!

Thanks, anybody.
I knew this comp.sys.atari.st thing on the internet would come in handy :-)

802. ST Fax software

Newsgroup: comp.sys.atari.st
Date: 1993-06-19 18:06:22 UTC
From: dunham@src.honeywell.com
Message-ID: <1993Jun19.180622.7876@src.honeywell.com>
Source record: 204328

I know this question has been asked before, but now that I own a Fax/Modem, here goes! Does anyone know where I might find either PD or commercial Fax software for the STe? I've got a Zoom 14.4K fax/modem. The only stuff I've found via ftp is HACK_FAX and HFAXBETA, which just support the ZyXEL modem. There must be _something_ out there for the Atari..??

Jonathan Whitcomb (whitcomb@aur.alcatel.com) wrote:
: I just bought the Bitmap Brother's new game The Chaos Engine.
: Unfortunately, it won't load on my Mega ST4. I have TOS V1.4, and an
: AdSpeed accellerator (which boots at 8 Meg). Color monitor, of course.
: I even disconnected all of my peripheral cables, but no go. I have
: several other Bitmap Brother's games that all load fine (Gods, Speedball
: 2, Magic Pockets, Cadaver).

: The frustrating part is that the game loads fine on the 520STFM that I
: just sold, so there doesn't seem to be anything wrong with the disk
: itself. Seems like there's some sort of copy protection that won't pass
: on my Mega.

: Anyone have any suggestions?

Try loading a program to make the memory less. I've used a reset proof ram
disk to do this in the past. One program I know of ran fine on systems with
2MB or less but wouldn't run on my Mega ST4. Anyway, I don't have the game
so I don't know if this will help.

> Get to know what's in your archive man!

Now now, no need to get nasty. I note that once again you refer to the
ICD utilities as PD. A better description would be "user distributable to some
degree". PD is incorrect. I have been told (on the phone with ICD) that
ICD does not mind individual users passing around the ICD software, but they
don't want it on private BBSs. They now have the software rigged so that the
caching in the user distributable version only works on ICD host adaptors.
This not only allows them to freely distribute updates to ICD hardware owners,
it also provides a "demo" version of their commercial ICD utilities package
(where caching does work on non-ICD adaptors). In the old days, the ICD
software would not function if a non-ICD adaptor was detected.

In an attempt to end this problem (at least for Internet folks), I am going to
call ICD and offer to be a semi-official ftp site for their software updates.
In other words, I am willing to make the stuff available on my anonymous ftp
site, and to prevent others from modifying it (to the best of ftpd's
ability :-). This would be purely as a courtesy, as I have no involvement
with ICD other than as a satisfied customer. I'll post their response.

ICD utilties can. It is now available for non-ICD host adaptors.

Try the Straight Fax, sold by Toad Computers, 1-800-448-TOAD. I think
they have a demo version, which they would probably send you. Post the
results!

>I am at least paranoid for my own good. Can anyone explain this any better or
>can word the analogy better, so that it doesn't sound as drastic.
>
> The Sequel

All that's happenning when you hear the loud automatic-firearm type noise,
is that the FDC tries to get the drive to a track above 80 (or 82, or
whatever the max track number is on your drive).
The arm motion of the drive is controlled by a grooved cylinder that spins,
and so the head moves forward/backward depending on the direction of the
rotation (I hope you get this, cause I don't know how else to explain it :)
But if the drive has it spin till what it would think track 134 is for
example, then there is no space left for the head to move, the pin in the
groove just bobs up and down, harmlesly.
It's scary, but nothing can happen :)

Patrick.

812. BIG PROBLEM -- NEED HELP !!!

Dear Friends:

I own an Atari 1040ST and I recently added :
1. 4096 KB of RAM
2. an 80MB hard drive
3. HBS 210 processor
I use Zignum's word-processor and when I finish, I save my document with
not an apparent problem!
Now, here my troubles begin:
when I recall the file that I previously saved,
either to 1)dump it at the screen or
2)print it
at the screen I see the message "SYSTEM ERROR - 97"
and the hard drive fills up with BAD sectors and I have to
reformat in order to reuse the program and all my data that I
previously inputed are GONE !
...please any ideas....
I would appreciate any help--I'm beat !-------e-mail:akakavel@dante.nmsu.edu

813. Atari or Amiga? Which to buy?

Source record: 204345

Midwinter II is one of those games which make you wish you had the PC version because they don't have this stupid floppy disk copy protection. It's not hard disk installable on the ST! I think it even uses only 512 KB Ram, no matter how much Ram is available. Besides this technical restrictions it's a great game.

>
>Can anybody clear my indecision and explain me your reasons?

If you want to play games more than you want to do serious work then get the Amiga (actually, you'd probably be better off with a SNES if you just want to play).

If you want to do serious work more than you want to play games then buy an ST. Second-hand systems including a HD are going *very* cheap at the moment since people are dumping them off in favour of Atari's new baby, the Falcon.

Which, of course, is another possibility. I know not of Falcon availability in your country - and your finances - but if you want a good machine that has a good chance of becoming a great games machine and an extremely versatile serious machine then get this. And don't be scared about incompatibility rumours, the Falcon can run just about everything that's important on the ST.

Of course, you could just go and buy a PC [g].

820. Falcon030 --> VME ???

Newsgroup: comp.sys.atari.st
Date: 1993-06-20 15:12:01 UTC
From: molin@ptb.cl.msu.edu
Message-ID: <201uo1$iha@msuinfo.cl.msu.edu>
Source record: 204350

I thought I had heard a while back that some German company was working
on an add-on VME interface for the Falcon030. Has anyone heard anything
more about this? What is the company's name/address/phone #, etc...

What I'm really hoping to discover is that there is some VME interface
for a Viking Moniterm monitor.

>Nope. 9600HST (drat).

If you call the ICD BBS with a non-HST modem, their modem will drop down to 2400MNP5 if your modem can support it. Since MNP5 doesn't seem to know when it can/cannot gain from data compression, you'll only get throughput at the equivalent of 1200bps if you try to transfer a .LZH file. Best to call them with data compression turned off...

>translated from an atari st to ms-dos format. I know dos (as well as un*x,
>mac, cpm, vax/vms, etc), but not atari. Is this operation trivial? if so,
>how?

If the disk was formatted on the dos machine, you can read from/write to
it directly in the Atari after verifying density. If it was formatted on
the Atari, you need to know what version of the operating system was used
in the formatting machine. TOS version 1.4+ used the MS-DOS format
standard.

If it was formatted ona pre-1.4 machine, you have two options:

1) look for a program called DCFORMAT on atari.archive. Us the MS-DOS
boot option...

2) with a sector editor, look at sector 0. Presuming the disk was
formatted to the standard 80 track/9 sector form, you can simply change
the first 3 bytes of sector 0 to EB 34 90.

Instead of dropping your ST, try opening it up and physically pushing on
the chips. ALL socketed chips, not just the square ones. There are
clips available at repair centers designed to hold the square chips in
place, look into getting some of those.

Dropping your ST is _not_ wise.

Rule #1: Atari for MIDI or sound stuff, Amiga for interface to video
If you are not interested in either, it may not matter.

Rule #2: Consider which one is supported better in your locale, via
stores, user groups, etc.

Rule #3: This should be in the advocacy group

Not commercial, but DEFINATELY commercial quality is the "GEMAR" program.
I used v1.01 on the weekend to backup 128M of my HD. Very fast (especially
since I was using a DAT drive!). It's in German, but is very easy to use,
and if I had a tape-drive (the DAT was borrowed), I'd take the time to
translate the RSC (and send it to the authors with the ShareWare fee).

Well I think the question is not impossible to answer here. But first of all, what do you need a computer for? Depending on your needs I'm sure we can help you. If youre needs are graphics intensive, I suggest an Amiga. If you are into Music then I suggest an ATARI. If its business, you may want to look at Mac or IBM, depending on your needs/compatibility and personal preference.

Agreed on Gasteiner, but NOT on the Silica Shop; I have always had great
trouble there finding someone that knows anything at all. Ofir's original
suggestion of the Atari Workshop (aka System Solutions) was the best bet,
in my experience.

>Can anybody clear my indecision and explain me your reasons?
What do you wantto DO with your computer? Both machines have strengths and
weaknesses. What kind of applications do you want to use? Do you think
it's likely you'll want to expand the system later and if so how?
Are you after any measure of filecompatability with another system?

I don't want to start any blasphemous rumours,
But I think that God's got a sick sense of humour - ML Gore

What's the trouble with Gasteiner ?? I've only used them once to buy
one of their Mega Drives and the only prob I had was getting some
technical support but I did get it eventually.

Would be interested in your stories.

Spot on, support here is rubbish. I've phoned the US over a technical problem and had an excellent response. However when it comes to updating my software, the only answer seems to be download from US bbs and to do that from here you need to be either loaded or daft (or possibly both).

BTW, when I'm next in US, can I borrow your phone :-)

Have you read your ATARI online magazines lately?

In an online conference, Bob Brodie stated that Garry Tramiel, President
of Atari U.S. called Toad up and tried to buy a Falcon030 through the
mail just to see if they would do it.

They asked him for his name and he said, "Garry Tramiel"

And they said to stop joking around. And he said that he was serious and
his name was really Garry Tramiel.

They then informed him that they cannot sell the Falcon030 through the
mail, but will sell him a hard disk or monitor.

The reason Garry Tramiel called was because he saw their ads for the Falcon030
and he was an important figure in making up this rule.

Try to keep up with what's going on, eh?

Len

Here... I hate just saying "I read in an online magazine" so I found
my source:

Z*NET: ATARI ONLINE MAGAZINE * Copyright (c)1993, Syndicate Publishing
Volume 8, Number 15 Issue #499 May 7, 1993 File:93-15

DATELINE ATARI!
Captured and Edited by Ron Kovacs

<FAIRWEATHER> I live in California. I'd like to buy a package of
Falcon, Multisync Monitor and custom hard drive from Toad Computers back
east. Will Atari's dealer agt. prevent this?

<BOB-BRODIE> Yes it will, David. We do not allow our dealers to mail
order unless it is to remote areas or where there is no dealer in the
area. In California, we have a number of dealers. There is no reason
that I can understand for you to have to order a system from Maryland.
They will be available for sale in California at the same point in time
that they are in Maryland, unless TOAD has decided that rather than keep
their demo units as demos, they want to sell them right away. We would
not approve for them to sell all the way to California...there are other
dealers here, closer to you that can service your needs without you
having to send all the way across the country for a computer.

<FAIRWEATHER> When will Falcon's be available for sale in California?
Two reasons. California has 8.5% sales tax and Toad makes custom drives

and monitors. When do you expect Falcon's to hit the streets?

<BOB-BRODIE> You are welcome to purchase your hard drives or monitors from Toad...but we have been very clear with them that they, as well as any other dealer, are not to mail order out of their area. If we find that there are violations, the dealer runs the risk of having his dealership revoked. Garry Tramiel is VERY firm on this. In fact, he actually saw an ad for Toad Computers asking people to call for their Falcon...so he did!! <grin> When they asked him what his name was, he didn't lie either! He said "My name is Garry Tramiel." They said "Right...what's your real name and Garry replied that it was really him. They indicated that they wouldn't sell him a computer, but would be happy to take his order for a monitor or a hard drive. :)

The next shipment of Falcons is on the way here via boat at this time. I checked with our factory rep just before the CO began and he indicated that they are about 10 calendar days away.

Why should we ?

What follows could be thought of as advertisement, so hit 'n' now if you don't
want to see it.

ICD's German address is (or was until recently - at least the postal code
will change soon):

ICD Inc.
Postfach 1317
D-W-6056 Heusenstamm

They've got a mailbox, and you can download the software from there. Sorry,
I don't have the phone number in reach.

(I am not connected to ICD, other than being a user of their products. Until
recently I'd have said "satisfied user", but there's the matter of MINIXFS
not working with ICD's hard disk driver cache :-( )

Greetings,

Jens.

I've just tried it - and it doesn't work. The primary reason is that
First Word Plus does not handle tabs properly i.e. on input any tabs in an
ASCI file gets expanded to the relevant no. of spaces - to comply with the
pre-set tabs in First Word's ruler.

I've pondered a lot on this - and my previously described long-winded
method I found by hacking is the only solution I've found (to get TABS inside
Calamus without them being converted to spaces).

But surely - since this feature is _SO_ important to anyone wishing
to produce columnar output, there _MUST_ be a more elegant way of doing it
in such a well-specified document processor as Calamus (I have version 1.09n).

Cheers,
W. Alan B. Evans

Source record: 204384

Has anyone ever figured out how to use the ms-dos or mac emulators to read CD-ROM disks on an atari st?

I would like to make use of some of the host of cd-rom databases now available, and it seems to me that the best way I can do this is to get rid of my ST and buy a MS-DOS machine.

I'd rather keep the ST, as it has served me well and I am used to it, but I don't think I have any other choice. And I don't have the time, the room, or the resources to try to keep the ST system going after I've acquired a new system.

I have been giving LOTS of attention to the subject of GIF files on the ST(e). Here is what I have learned about converting them into Atari formats:

1)It is desirable to do so. The redundant information that the GIF format stores (compressed as it is) means that any Atari specific format will result in a much smaller file on the ST. I've turned 50K GIF's into 5K *.TNY files.

2)The assorted conversion utilities all work differently, meaning that the picture that PCHROME3, for example, leaves dark, SPOFLIT will let you view and lighten, but not save as converted, while VIEW_ST often does an excellent job of shrinking large files but only into 16 colors. DMJ_GIF 3.0 is flicker free, but very slow, in turning GIF's into SPC files, but itself encounters files it can't turn into a decent picture (All these programs are available on the Michigan Archive).

Prism Paint will load and shrink any GIF your system can display without modification, but will not convert colors and often blacks out the screen after the conversion. GEMVIEW 2.24 pushes your system to the limits of the hardware in making its conversions, but no further, unlike such software-enhancers as PCHROME3, SPOFLIT, or DMJ_GIF. On the other hand, it can be used to lighten a GIF to the point where PCHROME can make a decent conversion of a dark one. I wish meine deutsch was gutt enough for me to understand how to adjust the RGB levels of the various pictures--monitors, and accordingly, exact amounts of Red, Blue, Green, and intensity, vary. Somebody ought to write a test program to figure out adjustments, if necessary.

If anybody knows of any better programs or routines, I'd love to hear about it. The best single advice I can offer is to determine how many colors and how large any GIF file is before you try to convert it, and learn within what limits each program does its best. Best overall, but still imperfect, is PCHROME3, but there are rumors of a world-beating DMJ_GIF 4.0 in the works that should surpass it.

The ATARI world is also in dire need of a program that will read and convert ATARI *.IFF art files, and show them slide-show fashion (unlike the exercrable, bell-ringing horror that came with Deluxe Paint). Not even GEMVIEW 2.24 can do that (although GLEE, long gone, could!). ATARI *.IFF files (compressed with a platform-specific algorithm) are nearly as small as TN? files and, unlike the latter, can still be loaded into Deluxe Paint. You can also compress BLOCK files in Deluxe Paint. Would-be world beaters, take note!!

Never say I think when it comes to Hard Drives or the Software version that you have, if we are to help you, you must have the correct facts firsts..

From the Seagate info that I have there is NO ! ST250R, but there is a ST251R, this is a 43 meg Formated Drive with 4 heads and 820 data Cylinders...

That Format data is supported in the ICD software that you have, there is no need to enter any details...

>for a Viking Moniterm monitor.

The Falcon with ADD On VME or in special cases (19" or Tower) with
up to 12 VME slots is available from:

rhothron gmbh
entenmuehlstrasse 57
w-6650 homburg/saar

If the card you mention is a standard VME card it will surely fit.

We have some old STs with VME slots and they work fine.

Hatari!

I don't want to continue this simple try for a computer-war, but:

In article <1993Jun16.133448.13826@iscsvax.uni.edu>, sinclap2954@iscsvax.uni.edu writes:
> For those who have $1299 for a Falcon, but are on a long waiting list, Apple
> has a machine for you and its called a Centris 610 with an 040. You can get
> one for $1299 for a 4/80 configuration....

Well, Users with an ATARI normally use the Music/Midi advantages, or the graphical ones (DTP, etc.). So the DSP is an absolute need for simple HD-IOs, if you want to make HD-Recording in excessive ways, you can easily connect some peripherial recorders. This is much cheaper than any other system!

Second, the graphix: The falcon easily can make up to 1280*960, even more for less than $100, have you ever tried that on a MAC? The lowest prive for a card like that on a MAC including the monitor is >$4000, if you want to work with it!

I think, that anyone who needs a fast, good computer should buy a Falcon, the Desktop-case from DDD, BlowUP030 and maybe the 36Mhz030/50MhzDSP-card, then noone can say, that this would not be "up to date". 'Course, 040 is better, and it will come, but then not just naked, just like in a MAC, but with DSP, good graphix, etc.

Waiting or Falconing - these are the best ways in my eyes... :)

Roland.

Try to set the software to not use XON/XOFF flow control. If the buffer
is really getting full the XOFF will still be too late. Just use
RTS/CTS checking and enable just that on the modem. And make sure you
have an RS 232 cable that supports it.

And another thing. Maybe you should load the CPX thing and lock the
serial port to (serial fix CPX) RTS/CTS via the CPX.

Erlend.

I like to have computer with terminal- ,game- ,wordprosessing-
and programming (Modula II) options.

I think, I thought that Atari might be that what I'm looking
for, (All but games w B/W display) but ...

1. Is there any pretty screen font for terminal use
(The build in it's awful - compare v. VGA fonts)

2. My experinces are related four years ago.
Are there any suitable (PD)programs for

-Terminal emulators > vt100 (or vt220)

-Modula II (for studies)

-MS-DOS/UNIX compatible
editors such as Emacs.

-MS-Word

3. Which are the _best_ MacIntosh emulators
on the market ?

-jr

>I am using an OMTI MFM controller and the Latest ICD formatting software
>(6.06, I think)/

Well, you got a few things mixed up there...

Your drive should be a ST251R, which indeed is a 40 meg drive. The R means
RLL, which describes the type of data encoding this drive is designed for.
You have but a MFM controller and not a RLL controller, so it is quite right that you only have 28 meg free after formatting, because your MFM controller omly uses 20 sectors per cylinder, and RLL uses 27!

So now you have 2 alternatives: you can run your drive as it is, in this caase you will just loose about 1/3 of the max. drive capacity, but this will not harm the drive, since you use less sectors per cylinder than allowed . OR you try to get an OMTI
RLL controller, then you can get the full 40 megs out of your drive.

So watch out next time, you see, one little character can cause a lot of trouble :-)

Len Stys wrote "Have you read your Atari online magazines lately?". Well, since I have had a falling out with Atari because I complained about their shabby treatment of dealers and VERY poor record on supplying goods on time (or at all), I have not received any Atari Explorer On-Line issues. Coincidence that AEOs stop arriving at the same time that Atari refuses to respond to any of my FAXes? Maybe, maybe not.

For about 4 years I busted my butt for Atari as a reseller. Prior to that I was a VAR for CHIANG in Ottawa. Prior to a VAR, I arrange group purchases of STs (e.g. in Dec 1985, about 40 people bought STs in a group purchase - that's in a town of 4000). When I complained about Atari's miserable track record of supplying me goods on time, I was suddenly cut off from all communications with Atari (everyone I contacted refused to reply to me).

So, when I hear about Atari's firm policy for FALCON resale, all I can say is that based on its track record, Atari needs to rethink its strategy of it surely WILL die.

Now, all you die hard Atari enthusiasts, please do not dump on me for stating the truth about Atari. I still love the systems and I wish that I had a FALCON. The best thing about Atari has always been the product. The rotten thing about Atari has always been Atari the organization. Of all the suppliers I have for any product, the ONLY one that I have had problems with, and consistently had problems with, has been Atari. This is an organization that has absolutely no idea how to please the client (and that includes dealers).

Christmas three years ago I advertised heavily for the Atari line of PCs. My original stock was defective or arrived extremely late. I still have a PC3 in stock to prove that I missed the market because of Atari's pooe delivery. Another Chistmas I advertised the LYNX; it came out after the holiday sale season and I lost more money. I advertised the MegaSTE and TTs. Initial supply was late and when Atari Canada was closed it took me three months to complete a TT sale (it took Atari that long to decide HOW it was going to supply product to Canada; Jeez, ever hear of UPS?). I advertised the FALCON last Christmas because, according to Brodie, Atari was not going to miss another of its target dates for product delivery. Guess what, I lost more money promoting a product that never appeared for the best retail period. Now, Atari's current dealer agreement for the FALCON and LYNX is basically on giant size cover-its-butt exercise that states the DEALER is ALWAYS the one to suffer if ANYTHING goes wrong.

Do I trust Atari the organization? Do I like Atari the organization? No, its upper management has proven itself to be the most inept group of computer resellers in the history of computing. Anyone who likes Atari equipment or anyone who develops products in support of Atari equipment

should be bloody concerned about Atari the Corporation. Atari's most significant problem right now is everytime it points a gun to its head it misses when it fires. It cannot even kill itself properly. What a pitiful excuse for a company whose dealer agreement states that it is a quality organization with an image. Mirror mirror on the wall - Atari you don't have an image!

Really depends on your definition of pretty, if you use one of the many
font selection programs then you can change the font to anything you wish.

I suggest fonsel.acc - I use it to get the system font to Bauhouse Bold

> 2. My experinces are related four years ago.

From: fergus@areaplg2.corp.mot.com
Message-ID: <1993Jun22.161011.28550@lmpsbbs.comm.mot.com>
Source record: 204208

Has anyone ever figured out how to use the ms-dos or mac emulators to read CD-ROM disks on an Atari ST?

I would like to make use of some of the host of cd-rom databases now available, and it seems to me that the best way I can do this is to get rid of my ST and buy a MS-DOS machine.

I'd rather keep the ST, as it has served me well and I am used to it, but I don't think I have any other choice. And I don't have the room, the time, or the energy to try to keep the ST system going after I've acquired a new, different system.

My my are you guys behind the times! I got a call from him last week,
and he asked me if I wanted to buy a Falcon per mail order from him.
You see, there trying to find out which potential customers would be
willing to buy a Falcon contrary to the rules, and put them on the
infamous NO_SALES list. So watch out!!!! If you get a call from GT,
don't do it.

They will, but you'll have to turn MultiTOS's memory protection off.

883. Replacement drive for MSTE?

Newsgroup: comp.sys.atari.st
Date: 1993-06-22 19:03:54 UTC
From: cordes@ac.dal.ca
Message-ID: <1993Jun22.160354.14554@ac.dal.ca>
Source record: 204210

Since the internal HD in my MegaSTE (the ST157N that came with the machine) seems to have packed it in, I'm considering a new drive. I can get a new Conner three and a half inch, 170 Meg, SCSI, Model No. CP 30170E, at a fairly reasonable price. I'm trying to find out if parity can be disabled (that's what's needed, isn't it? - are there other things to watch out for?). Does anyone have any comments about the suitability/usability of this drive with the MSTE, or have particular recommendations of good drives to use?

Thanks for any input.

John

No, actually, to which the dealer replied, "Yes, I've already sold six of
them already." He even sold one mail order because there wasn't a dealer
in that city at the time. He said he's getting another shipment tomorrow.

In a previous article, randyh@sad.hp.com (Randy Hosler) says:

>:
>
> If you were violating Atari's dealer agreement and the presedent of Atari
> called to ask if you were, What would you say? If Tramiel wants to check
> out stuff like this why doesn't he have Joe Somebody try to buy the
> computer? It looks like Atari management really is as bad as everyone says.

No, actually, they are getting smart. I think Garry Tramiel has really
shown some leadership in the last six months.

Garry wants to make dealers AWARE that they are not allowed to sell through
mail-order. He wants to put a scare into them, NOT get rid of them
as an Atari Dealership. Atari really cannot afford to get rid of any Atari
dealerships.

>:
>: The reason Garry Tramiel called was because he saw their ads for the Falcon030
>: and he was an important figure in making up this rule.
>
> If Atari really wants to get the Falcon out there then they should support
> big volume mail order places that can give the Falcon a competative price
> compared to clones and such.

"An Atari? What the hell is that?" says a person looking through a mail-order
catalog.

NO, in the short-run, Atari would make money from current Atari ST/STe users.
But, in the long-run, Atari would be out of luck.

Atari needs places to actually SHOW people why the Falcon030 is better than
a PC clone and they won't do it through mail-order.

As long as Atari can keep increasing Atari dealerships and then have a massive
print advertising campaign in October, November, December. The company
has a chance.

You are a _very_ ignorant man. The Jaguar project has been in existence since 1990 - long before the 3DO project was even a glimmer in anyone's mind. The project's intention was to manufacture and design a 64 bit RISC CPU - it is done, and is being manufactured. There is much more than a "prototype" in existance. Many developers are in possesion of development machines, and Atari has a "Jaguar lab". The reason that Atari only showed a video tape of certain Jaguar derived effects was because the date between the CES and the introduction is on the factor of several months - why waste a great deal of money hyping a machine that will not hit the shelves for maybe half a year?

Perhaps if you would look at facts, and not rely on your own illbegotten suppositions, the truth would become apparent. Unfortunately, you are far too stupid to do that...

You are correct concerning the jaguar chipset - up to a point.
From what I have been told, the processor (64 bit RISC), was
designed by Atari Microsystems, Atari's now defunct R&D
thinktank, with the help of Motorola. The support chips
were then designed and integrated with this processor by a
British company going by the name of "Flare" or "Flame"...

That's more information about the Jaguar than has been posted here in the last six months. Heck, ever! Do you have any sources to support all this? I.e., names of developers, places you saw and used the "more than prototype" machines, etc.

I met with the video game development staff at Atari HQ less than a year ago, and at that time there was no physical machine called a Jaguar, 64-bit or otherwise. In fact, even the Falcon was a mere prototype then. The Lynx was still their main interest.

Frankly, it sounds like you're buying into the ever-busy Atari Propaganda Machine's latest stories, but I'd love to hear some solid evidence that any of this is true.

Hello Atarians
As to the deal about Atari and their mailorder restrctions, my local dealer (7 miles) the only restrictions that have been placed on mail order are:
a dealer masy not advertise a price less than the suggested retail price.
a dealer may not quote a price (either by phone or by mail) at less than suggested retail price.
If a dealer is found to be breaking these rules they will be cut off from their supplies.

The idea is to give the folks who are willing to to give Atari the chance the opportunity to make a living as well as those guys who are planning to sell the hardware to make their money off of software.
Atari does have a DAMN good reason!

You obviously don't get the point.

By Garry ringing Toad, he was effectively (and politely) saying "We know
what you've been advertising, and we don't like it. Stop."

> If Atari really wants to get the Falcon out there then they should support
> big volume mail order places that can give the Falcon a competative price
> compared to clones and such.

... and make store-front dealerships unable to compete, stop selling the
Falcon, and stick to Big Name PC machines (IBM, Wang, whatever), which is
all they can sell for a decent margin.

Well, what do they do? Add a keyboard.

Bob Brodie said that it couldn't be used as a computer because it doesn't
have a keyboard or disk drive. This may be true, but some how I don't
believe that you CAN'T add a keyboard and disk drive.

Help. I just got my Falcon a few days ago and my MiGraph hand scanner won't work with Touch-Up 1.8 or Scan Lite by Wiz Works! The programs for these run, but when you actually try to scan something you get nothing on the screen. Once I got some garbage that was sort of in the shape of the thing I was scanning, but you really couldn't tell what it was. Do any of you hot programers have any ideas. I called MiGraph and they said it didn't work and it is not on their high priority list of fixes as they said there aren't enough FALCONS out there to warrant it. Haven't been able to get a hold of Wiz Works or Dr. Bob. Does anyone know anything about that?

901. .WAV players for ST?

Newsgroup: comp.sys.atari.st
Date: 1993-06-23 03:04:10 UTC
From: gregs@eskimo.com
Message-ID: <C920Iz.BMK@eskimo.com>
Source record: 204232

Help!

I've downloaded a bunch of .WAV files (the Windows sound files for the P.C.) thinking I had a working player.

However, it doesn't seem to work. I think I either got a bad copy or it simply won't work correctly. The one I have is called (oddly enough) WAVEPLAY by one B. Grier.

It correctly identifies the WAV files, and even gives me information on how long the sample is in seconds. But then I get a two-bomb BUS error.

Now I can't find the program anywhere to see if it's faulty, and no other WAV player even seems to exist.

If anyone has any information on this please let me know, either here or email.

Thanks in advance,

G. Sumner

Gosh, Chris (Millar)... don't you think it's a little ignorant, and yes, even stupid to come out foaming at the mouth and flame someone without even identifying who you're flaming..?

Whoever it was, I'm sure he feels soundly chastised now, and willing to come meekly back into the fold.

Incidentally, do YOU have a clue about what the Summer Consumer Electronics Show is all about..? Apparently not. The Summer CES is when all the sales contacts are made for the Christmas selling season.. (that "machine that will not hit the shelves for maybe half a year".. umm.. that would put it just about Christmas...)

Any product that isn't shown at the Summer CES can just about forget any Christmas season sales..

Oh.. wait a second.. sorry...

I forgot.. this is Atari we're talking about.. they never worry about anythin as insignificant as Christmas sales.. they go for the big Feburary selling season... (or March, or April... yeah, that's it.. the "April Fools" Selling Season..

I am looking for Pretty Good Privacy 2.2 for the Atari. Was wondering if anyone had seen it on internet somewhere?

I have Archie'd for it, but still nothing has come up. Trying to use this encryption program for I.S.I.S. A network program that has been developed for the ST Market and soon for the IBM. Any help on were we can get the ST version would be immensely helpful.

Since there seems to be something 'wierd' (thats waht I would describe it
as) at Atari Explorer, AEO has been 'affected'

Sorry, I can't say much else, but that will have to do. AEO is a bunch of
writers who really don't have much but an official 'stamp' put on their
work. We don't all live in the same state even.

I'll try to find out whats going on and get back to you.

clarkep@vax.sbu.ac.uk writes:

>Does anyone know where I can find a posting of AIM3? I have read in a magazine
>of its existance? If not then I am interested in the conversion:
> IMG<=>IM

Well, I know about it. I wrote it. There is a new version which can read the
following formats:
IM, COL, IMG, DEGAS, NEO, TIFF, FITS, GIF, PCX.
And it supports (partly) the Falcon. Only gray value and binary image display.
No DSP support though, it's too hard (takes too much time) to program.

I am not sure if there are copies floating around, otherwise I will send one
to the comp.binaries.atari.st manager.

Is LHArc with Method 5 not available on atari archive (I believe in
Archives/Unix/)? If so, I will quickly upload it there! I have
lha-1.00, and it does all the following:

-lh0- * no compression

-lh1- * 4k sliding dictionary(max 60 bytes) + dynamic Huffman
+ fixed encoding of position

-lh2- 8k sliding dictionary(max 256 bytes) + dynamic Huffman

-lh3- 8k sliding dictionary(max 256 bytes) + static Huffman

-lh4- * 4k sliding dictionary(max 256 bytes) + static Huffman
+ improved encoding of position and trees

-lh5- * 8k sliding dictionary(max 256 bytes) + static Huffman
+ improved encoding of position and trees

-lzs- 2k sliding dictionary(max 17 bytes)

-lz4- no compression

-lz5- 4k sliding dictionary(max 17 bytes)

By the way, there is a file which describes header information (this
pertains to another question that was asked on the net).

You can use '525' to convert the WAV files to plain sample data
files or AVR files that can be played on many other programs then.

'525' is available at a.a.u.e for example.

Since RLL controllers squeeze about a third more data out of the same
disk geometry, getting 28 MB MFM data from a 40 MB RLL drive looks
quite OK to me. That's probably as far as you can go with a MFM
controller and this drive!

Well, here we go...

I've been waiting a year and a half for the Falcon. I was going to get a Mega STe but held off on Falcon rumors. Stupid. By the time it was obvious Falcon would be way late and overpriced, the Megas were gone.

I called the nearest Atari dealer (a two hour drive) and he will not stock until his distributor (Pacific Sales?) has them, since he will no longer deal with Atari (too much hassle on returns, etc.) The distributor will not have units until *September*. Maybe...

I can understand all this crap about why mail order could possibly hurt BUT I still cannot buy a Falcon unless I drive to Maryland (only a day's drive) to Toad, who seems to be the nearest dealer with units.

This is so pathetic, I can't believe it.

Source record: 204246

I finally got myself a Falcon in the Netherlands last week! ;-)
Many thanks to all who responded to my last message.

I really like this machine, but the compatibility problems are irritating.
To make this a little better I suggest we (Falcon owners) try to assemble a
list of compatible programs. The list should specify what options should be set
in "backward", "magi" or whatever ST-emulator, if necessary.
If people can see that many of the ST games runs, more Falcons will be sold.

What do you think?

This is a short list of what I've tried so far:

MicroProse Golf crashes at the end of the intro. Probably sound problems.
MicroProse Formula One Grand Prix runs with some options set!
EPIC runs all the way through the intro, but crashes just before the cockpit
instruments are drawn. This is probably possible to fix somehow.
PSION Chess runs fine.

By the way, MGIF 4.2 will be released as soon as I get gcc up and running on

So unless he's lying, what? It exists in some prototype form? Great,
but that hardly backs up all of Chris's claims about it already being
manufactured, its capabilities and its development system, etc.

Who is this developer? What is he writing? What does he think of the
machine? If you say "he can't say because he's under nondisclosure,"
then you have to admit that the public really knows very little about
the Jaguar -- essentially *nothing*. Which is why I think it's a
little premature to compare it favorably with the 3DO or any other
machine. Or, for that matter, to speculate about the feasability
of the next Atari computer being Jaguar-based.

I do know that the major game companies (Sierra, Lucasfilms,
Microprose, etc.) have been given offers to develop for the 3DO, and
many of those companies now have machines in house, complete with the
(very impressive) mac-based development software. This is NOT true of
Atari's Jaguar, just as it is not (and has never been) the case that
those developers are eagerly writing games for the Falcon. Of course,
Atari will probably lie and tell you that "literally hundreds of titles
are being developed behind closed doors." Yeah, we've heard that one
before, about their "new" machine that came out last August ... I mean,
this August.

Well, I finally got to play with a Falcon030 today! It was a demo unit at Kurlan Music right here in Worcester Mass. He didn't have any spectacular demos to show me, but I was able to make a few impressions...

The sound was great! Much clearer than my roomate's 486/SoundBlaster. Even from the monitor's speakers it sounded great. The graphics, though, were surprisingly poor. My ST can do as good... Perhaps it was because he didn't have a VGA monitor. Still, the "UK Demos" he showed me wouldn't win any sales... Also, he hadn't gotten D2D or Audio Fun Machine working so he didn't have much to show me. He said he'd have it more "demo-able" in a few weeks when he gets some more software to run on it. Also, the machine itself just leaves me dry. I mean, it looks almost exactly like the 1040STf he had demoing sequencing packages... In fact, I'd bet that under the cheap-looking "Falcon030" sticker it says 1040STf! It certainly does not look like a $1200 machine! I wish they'd packaged them in the pretty Mega cases...

He did have lots of ST (and Mac) software in stock and the new issue of Atari Explorer. I was really surprised to find a Falcon so close to home!

Also, he says he's already received and sold his first batch of six Falcons and expects a few more in the next few days. If anyone in the area wants to give them a look, go to Kurlan Music Center on 17 E. Mountain St., Worcester MA. Ask for Brian Arel and tell them that Stephen Foskett told you about the place on the net...

One more thing: Does anyone have more information on the purported Falcon rackmount music workstation? If I was to buy one, that's what I'd buy...

later,

.s.

> British company going by the name of "Flare" or "Flame"...

I was recently speaking via email to a bloke who is currently programming a game on a developer's jaguar. He reports that it's an excellent machine, has *two* RISC chips, a DSP chip for (mainly) sound and a 68000 (!) running at 16Mhz. The latter is purely for a little control code and shouldn't be seen as a weak link.

Just received the latest AEO; thanks to whoever read my last net post and fixed this for me.

926. mail order restrictions (again)

Newsgroup: comp.sys.atari.st
Date: 1993-06-23 14:51:17 UTC
From: csullogg@cc4.crl.aecl.ca
Message-ID: <23JUN93.10511729@cc4.crl.aecl.ca>
Source record: 204250

RE: Lee Higginbotham's post that Atari has a damn good reason for mail order restrictions. First, it should be allowed universally or disallowed universally. Why should one dealer play by different rules.

Second, the rule is made by folks living in urban areas who think like urbanites. My business is located in the "near north" region of Ontario Canada. The town I live in has 4000 people. I have maintained a fairly successful business selling Atari hardware/software/peripherals mail order to clients located in small centres like the one I live in. On occassion I have sold to clients in major centres because they expressed strong unhappiness with their local suplier OR there was no local supplier. I have sold systems from New Brunswick to British Columbia but, by far, the bulk of my sales have been to clients in rural communities. Sales were based principally on the fact that I would drive to the client's home (sometimes 200 km away) and teach them how to use their systems. I also have a loyal following of clients who come to me exclusively for products and support because they know I stand behind everything I sell. And, when Atari has caused the client significant delay by not supplying product to me on time, I either discount the purchase or supply software at no charge to compensate. NEVER does the client go unrewarded for its patience (i.e. I covered for Atari's inept ability as a supplier).

So, when I see the dealer agreement that says SOME dealers may be authorized for mail order and some not, it ticks me off. At any time, I could be cut off from Atari just by shipping a system to the wrong location. That's an agreement I am not willing to enter into.

927. Atari 7800

Source record: 204258

I can't believe I'm saying this <gasp>, but you Mac guys are
beating a dead horse here. EVERYONE knows what Macs are
selling for these days and it seems pointless to keep twisting
the tails of prospective falcon buyers. Those people are going
to buy one out of brand loyalty anyway. Let the market decide
which platform will sell. (As if there is any question about that)

If you are still intent on annoying Atari users, there are
many other more informative ways of doing so without giving
us a Mac price update every other day.

<Gosh, I must have a fever or something...taking an aspirin>

Peace,

Chris

931. The Glendale Show, Version 7.0

Newsgroup: comp.sys.atari.st
Date: 1993-06-23 15:37:15 UTC
From: hutch@bellman.lanl.gov
Message-ID: <1993Jun23.153715.9959@newshost.lanl.gov>
Source record: 204257

Good News! The Glendale Show has been officially announced by John King Tarpinian, the Faire Chairperson. Here's the press release from GEnie:

==========

The Glendale Show, Version 7.0, The Legend Continues.

The show will be held Saturday and Sunday, September 18-19, 1993 at the Glendale Civic Auditorium, 1041 N. Verduqo Road, Glendale, CA. Hours are 10:00 am to 6:00 pm on Saturday and 10:00 am to 4:00 pm on Sunday.

General Admission is $5.00 per person. If you plan on attending and you live outside of Southern California you may get FREE admission by sending a self-addressed-stamped-#10 envelope (the long one) to H.A.C.K.S., 249 N. Brand Bl. #321, Glendale, CA 91203 and get two one day passes.

For those of you who will be needing lodging we have made arrangements with the New Red Lion Hotel in Glendale. Regular rates are $129.00 per night but if you mention ATARI/HACKS you will get a room for $79.00 per night, single or double occupancy. Reservations may be made by calling the Red Lion at 818-956-5466. The hotel has a free shuttle from the Burbank Airport. The guaranteed reservation cut-off date is August 28th. If you are quoted another rate ask for Janet Waldie in Sales.

Atari will be doing something very special in conjunction with this year's show. Look for more details soon.

Look for our full-page advertisement in upcoming issues of AtariUser magazine. If you have any questions send mail to H.A.C.K.S., 249 N. Brand Bl. #321, Glendale, CA 91203 or leave GEmail to John.King.T or call John King Tarpinian at 818-246-7276.

John King Tarpinian
Faire Chairperson
The Glendale Show

==========

Glendale has always been a lot of fun and I urge all those who can possible make it to definitely plan on attending. I know that I'll be there!

933. WHAT IS ATARI DOING WRONG -- reply e-mail if possible

Newsgroup: comp.sys.atari.st
Date: 1993-06-23 16:16:37 UTC
From: aa399@cleveland.Freenet.Edu
Message-ID: <209vl5$r58@usenet.INS.CWRU.Edu>
Source record: 204260

Please reply e-mail if possible. I don't want this taking space up on the net.
Thanks!

I plan to send a long letter to the President of Atari U.S., Garry Tramiel
(since he seems to be showing at least some leadership at Atari) and I would
like for you to give me your input.

If you have observed a problem concerning Atari that you believe is hurting
the company and the Atari Community, please let me know what it is.

Some topics that I have seen mentioned here in the past that I would like
to hear more about may be:

Dealers getting blacklisted (or just ignored).
Dealers having problems with Atari concerning orders, etc.
Past dealers having problems with Atari concerning orders.
Dealers that have not signed the Atari Dealer agreement or have signed,
but are unhappy with it.
Lack of Atari computer dealers in your area.
Lack of Lynx dealers in your area.
Lack of game cards at Lynx dealers.
Lynx dealer having problems with selling the Lynx and game cards.
Developers problems (lack of support, etc. that prevent a developer from
getting software out.
Developers having distribution problems (especially overseas).
Lynx programmers having problems finding distributors for their games.
Lynx programmers not getting paid from Atari on time.
Atari publications not getting enough information from Atari on what is
going on with the Falcon030, etc.
Atari publications not getting paid for Atari advertisements or not getting
paid on time.
Atari User Groups not hearing anything from Atari concerning anything.
Atari computer users that cannot find Atari dealers.
Atari computer users that cannot find software and hardware.
Atari computer users that feel the computer platform that they purchased
is being unsupported (and why you feel that way).
Atari Portfolio users that are not happy with the support that they are
receiving or not receiving.

There are of course, MANY MANY things that are not listed that you can let
me know about.

But, let's make this letter even better. What do you think Atari needs
to do to correct the problems that you see. Or how would YOU correct them.

Now, what has Atari been doing that you believe they are doing right?

Some topics:

The "no mail-order policy" agreement.
Shipment of Falcon030 orders.
Free update to "Atari Works" to owners of the Falcon030.
Making Multi-TOS availabe to all ST users.
Attending Atari Shows.

I am sure this list can go on and on...

So, what I really need to know is:

What have YOU noticed Atari doing wrong that has been hurting the company?
What do you think they should do to correct the problem? Or what would
you do to correct the problem?
What have YOU noticed Atari doing right that has contributed to the
company's success?

Please let me know if I should leave your name on your concerns or if I
should remove it?

Also, let me know where you are from.

Even though this is to Garry Tramiel of Atari U.S., all international
users may send me their concerns as well.

I will post the response to our concerns PUBLICLY when I get one.

Thank you.

>Of all the suppliers I have for any product, the ONLY one that I have
>had problems with, and consistently had problems with, has been Atari.
>This is an organization that has absolutely no idea how to please the
>client (and that includes dealers).
>
Both of my Lynx systems died while attached to the auto power
adapter (they still worked w/batteries). I sent both of them
back with the adapter to Atari's warranty address on Caribbean Avenue.
In one week (!!!), I had two brand new Lynx and a brand new power adapter.
That tells me that maybe (just maybe), Atari is beginning to provide
a positive level of support.

>
>Do I trust Atari the organization? Do I like Atari the organization?

You've got a point, there. The packing list in my box of warranty-
replacement Lynx' showed a return address of:

Atari Computer Corporation
Consumer Direct Sales
1196 Borregas Avenue
Sunnyvale, CA 94088

Consumer Direct Sales, when dealers in other threads are
complaining that they are not allowed to sell via mail order?
It appears to be a conflict of some sort, here!

Source record: 204259

Hi!

I'm utterly stuck on Level 3 of Cadaver - TPO. Can anybody out there tell me how to get past the 2 magic mouths that ask for water in the right way? I've given the one that asks for 4 doses (because I only have 4) all the water I have but the way forward seems to be blocked after leaving the room!!

Don't tell me I'm the only person who has ever played this game!!!!!

I dunno if this is quite the right Atari ST group to mail, but - Hey! - desperate times call for desperate measures!!!

Thanks for any help!

Chris

Anyone know where to get a program to edit the voices and do other wierd
things to a Yamaha PSS 480 (PSS anything) keyboard.

I would prefer an ST version but if there is one for the amiga I would look at
it anyway. Alternatively Does anyone have any info about how I would go about
writing a program to control this keyboard. Like The format of the bulk memory
dump or technical stuff like that.

1.) Several months ago, I spoke to a man who claimed to have
been in the "Jaguar Lab" and had seen a prototype in action.
I hate doing this (because I hate when others do this to me! <G>),
but this man will have to remain anon. for now. I've known him
for enough time to trust him, though, and he is very closely
connected to Atari Explorer Online...

2.) Although no one at Atari has ever confirmed this, I am
fairly certain about the timetable of the Jaguar project.
I recently found out a great deal of this when I spoke to
a man who worked for an advertising agency which Atari had
contracted to do prelimary advertising work a while ago.
I'll try to get more information from him, and about him.
Sit tight.

3.) It's no secret that Atari Microsystems, Atari ex-R&D
department in Texas, had close ties with Motorola. It
is now a documented fact that Atari developed a 64 bit RISC
CPU, with the help of Motorola, there. This has been
confirmed by every Atari official I know, besides some
outside sources.

if you have any specific questions, feel free to ask, although
I'll be the first to admit that there is a great deal I do not
know about the Jaguar. BTW, don't be surprised about the
ignorance of those at Atari you spoke to - All of thw work
on the Jaguar was done in Texas and then contracted out to the UK.
The project was not moved to Atari HQ in Cali until it was finished.
Apparently, the hardware was not quite finished until a few months
ago...

To: sabbath@cix.compulink.co.uk (Graeme Rutt)

Fascinating! I admit that my knowledge of the Jag's architecture is very limited, but what your friend has been saying sounds like it could fit in very well with what I have found out...

I knew if the DSP, but the dual RISC chip is new to me - perhaps Atari has two parallel processing 32 bit RISC chips going for it. Vary nice.....very nice indeed. And you have to love a machine which uses a 16Mhz 68000 as a support chip! Let's hope this is true.....Any more info would be much appreicated! You can email me if necessary...

Yes, that is true. However, you might try giving the product a change before
you start to shoot it out of the water!

> Who is this developer? What is he writing? What does he think of the

> of the next Atari computer being Jaguar-based.

Is it any or your business who this developer is? I don't think so. Atari don't have to tell you ANYTHING. They don't have to pass their plans by Mr. Baggett before they proceed. As for comparisons, that is true.. You can't make them at this point. You don't know anything about the machine.

> I do know that the major game companies (Sierra, Lucasfilms,

> this August.

I do know that they are working on lots of games at this point. I do know that the project is progressing nicely. I do know much more than I am allowed
to write here. If you don't like that, that's your problem.

Me thinks that someone is just alittle upset that their game development system wasn't what Atari was looking for.

I am planing on buying a laser printer for the atari st. I want to use
it with TeX and would appreciate info/experiences with the
atari laser printer, the HP laserjet IIP and the new(?) epson action 1000 in
HP and postscript modes.

Has anyone used the Epson Action 1000? for TeX?

Any recommendations (ftp sites) for dvihp or dvips programs for the ST ?

I'd appreciate e-mail.

Thanks

Mike

> the dodo bird (i.e. extinct). I called their office many months ago, and
> got a return call from John T. stating that they would publish again "as
> soon as the Falcon is released." Well, the Falcon has been released,
> and still no AtariUser. What gives?

Last I heard was that John Nagy had financial difficulties, due to smashing
up his car (while running a batch of AtariUsers from the printer, or
somesuch). That, coupled with late payments by some of AtariUser's
advertisers, caused the magazine to suspend publication for a while and catch
a breath.

I am working on the presumption that John T. and John N. are still
earnestly trying to put out the magazine -- what is the point of telling
people you are going to publish a FREE publication if you're not? It'd be
easier to just say "Oops, sorry, we folded" if that was what happened, after
all.

Besides, there's still the rest of that "All-Lynx resource" promised (but
omitted) from the December 1992 issue. And there's probably a TON of Lynx
game reviews in the queue... *Smirk*

Keep in mind that this is a DEVELOPER'S developing unit. It is most likely
an altered version of the Jaguar.

Atari may have put those extra chips in just to help out the developer.

From: dmb@case.ai.mit.edu
Message-ID: <20becsINN10d@life.ai.mit.edu>
Source record: 204292

In article <John_Townsend-230693155941@townsend.taligent.com> John_Townsend@taligent.com (John Townsend) writes:
>Yes, that is true. However, you might try giving the product a change
>before you start to shoot it out of the water!

Yes, John, but this is *Atari* we're talking about, not a company that has a decent track record. Atari couldn't even get the *Falcon* out, and it's not even state of the art! Here we're talking about a supposed 64-bit machine, with all sorts of whiz-bang coprocessors.

NO ONE in the mainstream is interested in "giving Atari a chance." Nintendo and SEGA are out there. 3DO has real, working hardware, and they have many developers on board as well as developer perks like the l70+ CD library of license-free video and audio clips ready for use in games. Atari has more than used up its get out of jail free cards. Frankly, no one in the console/compute games business even takes Atari seriously anymore as far as I can tell. "Atari at CES? Who's Atari? Didn't they go under years ago?"

Further, less than 5% of the "news" that comes out of Atari HQ is actually true, so why should we believe the latest propaganda about the Jaguar, much less begin calling each other ignorant for not knowing how great a machine it is?

>Is it any or your business who this developer is? I don't think so. Atari
>don't have to tell you ANYTHING.

CLAIMS WERE MADE. I'm only asking that they be supported. It's my business, to the same extent it is everyone else on this group's. A post about "some developer" developing "some game" is useless; without some sources to back it up, there's no reason to believe anything in it any more than there is to believe the family of compulsive liars that run Atari Corp when they said in that *ridiculous* press release that the Jaguar would "revolutionize" this and that.

>They don't have to pass their plans by Mr. Baggett before they
>proceed. As for comparisons, that is true.. You can't make them at this
>point. You don't know anything about the machine.

My personal contact with this machine has nothing do with anything. Has *anyone* here used the machine? Written anything for it? If so, speak up, because otherwise we have NO factual information to go on, and we might as well not even be speculating, much less insulting each other. With regard to the 3DO, however, we do have factual infromation, because I've used one and have posted about it here (as have others).

Since you're an ex-Atari employee, and are giving the impression of being "in the know" would you care to help us out? If not, don't flame anyone for not believing the latest rumors. And *certainly* don't flame anyone for being skeptical. Again, this is *Atari* we're talking about.

>I do know that they are working on lots of games at this point. I do
>know that the project is progressing nicely. I do know much more than I
>am allowed to write here. If you don't like that, that's your problem.

First, who are "They?"

Second, why should I believe this from you any more than from any other random person, or, for that matter, Atari? Unless you're willing to put a name or number where your mouth is, you have added nothing to what we know.

E.g., what companies? What games? Who? Jeff Minter? Anyone? Surely you can give us something we can actually CHECK, right? Otherwise don't waste our time with what amount to unverifyable rumors. We have more than enough of those here.

>Me thinks that someone is just a little upset that their game development
>system wasn't what Atari was looking for.

I should really flame you into an unrecognizeable charred mass for this comment, but I'll force myself to be civil.

You and the 10,000 other armchair psyhciatrists in this group can speculate all you want. What I wish for in the Atari world right now more than anything is that my name recognition in the community wouldn't get me continuously typecast into a cut-out cardboard figure. I've made no money off the Atari community, given away thousands of hours of work, gotten completely screwed as a freelancer, tried my damndest to get the company and the users to honestly assess the state of affairs, and this is what I get in return. Thanks a bunch. If it weren't for all the great people I've met along the way, I'd wonder if it was worth it. But hey, maybe HacMan II got me into MIT. (Ha-ha.)

Really, I can't post a single note here anymore without someone leaping the kind of ridiculous conclusion you've reached here, and even worse, as in this case, reading more into my opinions than is actually there, and then flaming me for what they've made up and silently attributed to me! Frankly, I'm getting pretty damn sick of it. :P So there.

It seems all too easy to write off someone's opinions in one fell swoop with "oh he just has a personal problem with Atari," doesn't it? When people get exasperated because they can't answer BobR's objections they resort to the same pitiful tactic, over and over again. It's pathetic. Yes, I know it's Usenet, but argue with facts, not flames.

And how could you be so ignorant of what transpired when you were there? You KNOW what they did, and YOU were one of the ones who told us that kind of stuff went on all the time -- that we weren't alone and

that you were pretty damn sick of it all yourself. Hell, you guys were all talking with us about where you were looking for jobs! (And I'm genuinely happy to see that you've all done well in that regard.)

Atari *invited* us to show them GW. Specifically, Bill Rehbock did, and Mike had talked to John Skrutch about it weeks in advance as well. At that time I was already busy with other things (like making money for a change), and DC and Neil and I had already had a falling out. I'd already largely written DC off at that point (Mike had been AWOL for weeks before he called me out of the blue about the Sunnyvale invitation), and we were discussing ways to get the rights back so we could release the system on our own. I was hardly staking anything on Atari's interest in GW. In fact, I didn't even really want to go, but Mike convinced me, and I was, to be honest, a bit curious to see the much-vaunted Atari HQ in person. To say that I was underwhelmed would be an understatement.

But it was interesting in that it was a potential opportunity, though since we had never expected it to happen, we had no expectations. (Or at least I didn't. Mike may have.) Furthermore, at that time I was already convinced that Atari (Falcon or no) was a waste of time, and that the PC was a much more viable platform for GW. So your suggestion that the little fiasco in Sunnyvale has lead me to wish for the Jaguar's failure is, in addition to being fairly insulting, completely incorrect.

I admit that it has left me with a very bad impression of Atari in general, such that I don't really believe anything they say until I see some *real* facts from *real* sources to back it up. In fact, the whole thing was very enlightening: it drove home the importance of professional behavior even in a fairly loose high-tech setting, showed me first-hand how different a company can make itself appear on the outside versus the reality inside, and how utterly in the dark many professional game programmers are about software development methodology.

Those guys had obviously grown up writing 2600 carts. I spent that time of my life hacking MACH internals and other operating systems code. Big difference in approach. Those 2600 coders who can't adapt to writing large-scale applications (which is what games are now) will be selected out of the system. And considering the unbelievable pomposity of the Atari employees that fit into that category, I can't say that I have any sympathy.

Atari is a laughably bad company now, and all the cheerleading and BobR bashing in the world isn't going to change that. And, contrary to your pompous psychoanalysis, this saddens me. I would love to see the Jaguar do well. But I have seen and used the 3DO, and it is an awesome force to be reckoned with. SEGA and Nintendo, with their 95+% market share, should be very worried.

I can't believe that an Atari in such disarray a year ago could produce anything that could compete with the 3DO. But hey, prove me wrong -- tell me what the Jaguar does, what the development system is like, and who can corroborate the whole story.

If people are going to post claims about the Jaguar here, I don't see why I shouldn't them to task by, god forbid, asking for sources. Sources that, for example, back up the claims that the machine is being manufactured NOW, that it's even possible that it could sell for $200, that it has an "excellent" development system, etc.

Dave Baggett

>control code and shouldn't be seen as a weak link.

Well, this is starting to sound interesting. If this person is willing
to tell us, I'd like to hear answers to the following:

- In addition to the usual questions about resolution and palette size,
how many sprites does it support at once, and how big can they be?

- Does it do sprite transformations (rotation, scaling, warping)
in hardware?

- Does it have an alpha channel; i.e., will it support any kind of
hardware transparency effects?

- Is there a floating point unit?

- How much RAM does it have?

- Does it take carts or CD-ROM's? If carts, how big can they be?

- How many scrolling planes does it support?

- What are the development tools? Is there a C/C++ compiler, do you
use a Mac or PC as a front end, etc.

- What kind of development library does it come with?

- How much does it cost to become a developer?

- What is the policy on making carts/discs for it; is it license free,
or per-copy fee as with Nintendo?

Hello,

I have a question about the game 'civilisation' for the Atari ST: Does it run on a TT030 with TOS 3.06? There is no local Atari dealer here in Jena, so I cannot try it myself... but I would like to know about this before I order it via mail.

Please reply via email, because I do not read this group regularly.

Thanks in advance,
Joerg.

>in "backward", "magi" or whatever ST-emulator, if necessary.
>If people can see that many of the ST games runs, more Falcons will be sold.

I have also tried some games on the Falcon:
Pirates, Speedball2, Amberstar - don't run.
Popoulus I and II are running (with Magi or Backward),
Railroad Tycoon will run 30-60 Minutes with Backward (then HD-Problems),
Their finest Hour (runs without any 'STE-Emulator' - nice speed),
all Sierra adventures are running,
all Lucasfilm adventures (Monkey Island, Indy III, Zak McKracken...) run,
Lemmings 2 runs (with Backward - Lemmings 1 doesn't),
Gobliins 2 runs (with Magi or Backward),
Civilization seems only to run from Disk,
...and more...

Ciao, Heiko.

All of the Yamaha kit I have prints the SysEx format in the back of the
manuals. Failing that, just call them; they were quite helpful the last time
I wanted some info (several years ago, though).

I made a list of about 50 games, and whether or not they ran (I didn't
have backward then) which I made when I first got my Falcon...I can update it
with some backward settings and post it soon, if you like...
When I made the list I put down why it didn't load, so should help some people.

zxmng01> if you think that was great wait 'till you hook it up to to
zxmng01> your HiFi

He had it hooked up to a pair of Yamaha NS-10s (those of you who know
about speakers will promptly groan) and a no-name rackmount music
amp... Remember, this is a music store... And the sound was
unbelievable. In response to the other thread, there was NO noise
that I could hear.

> The graphics,
>though, were surprisingly poor. My ST can do as good... Perhaps it
>was because he didn't have a VGA monitor.
zxmng01> ^^^^^^^^^^^^^^^^^^^^^^^^^ Ehem, if one would connect a 1955
zxmng01> singles stack box up to a top of the line amp, the
zxmng01> dissapointment would be the same. I can't believe he's doing
zxmng01> this! Believe me, with a good monitor there is quite a
zxmng01> difference, and the ST doesn't win that one.

It's really surprising about this. After all, he was demonstrating
the Falcon for someone who showed interest in buying one (me!) and yet
he used the Atari SC14xx (whatever) monitor and had NO demo programs
to show me! Perhaps Atari should work on making a knock-your-socks-
off demo for the Falcon. If I was a "regular customer" (as opposed to
an Atarian) I wouldn't have given the Falcon a second look. I would
have said "that's nice. Let me see the MacIntoshes..." (well, _I_
wouldn't have said that, but you get the point...)

>I wish they'd packaged them in the pretty Mega cases...
zxmng01> I'm with you on that one. Lets hope that ATARI ..... well
zxmng01> ....., you always could put it in a tower (and if you should
zxmng01> buy any of the extention boards -with Fast-Ram etc.. - you'll
zxmng01> have to ;)).

And what about COOLING? My ST gets damn hot when I'm running it for a
while! I was even thinking of installing a little fan... And it's
got some room inside the case... I imagine a Falcon would just FRY!

.s.
(BTW: the shareware (?) game "Atax" is really great. Check it out!)

Hi greg,
This program only works with an STE, TT, and possible the FALCON.
The two bombs on the ST occur when trying to access the DMA sound sub-system.
The source should be in the archive, some place, otherwise it is on GEnie.
I am working on a faster version, and I am looking at supporting an ST.

If you can not find the sources send me email and I'll send them to you.
I do not plan on posting to the archive until the next version is complete.

Brian

There is a very good mod player in the Falcon directory at a.a.u.e, it

plays 8 bit mods in 16 bit mods I think, but i guess it won't be long before
new 16bit mods are available. I use it and its great, it impressed my friends.

Cannot understand why the Falcon dir would be locked, I have never had that
problen, if you do try one of its mirrors like src.doc.ic.ac.uk.

That's all I know, Chris - and that sounds enough to make it sound like a remarkable console. Of course, there are plenty of remarkable computers currently residing in the 'where are they now?' file. I have a hunch that it's getting pretty close to make and break time for Atari and the camel's straw or Athurian grail is going to be the Jaguar - and certainly not the Falcon. Personally, I wish them every success as the bottom line is that they've so far given me 12 years of pleasure out of the computers I've owned.

Can you tell me any more about your hunch that this 'other' console will be able to become a real computer? Are we talking a Falcon based machine which will eventually be able to take a keyboard, for instance?

Christopher M. Millar writes:
>
> 1.) Several months ago, I spoke to a man who claimed to have
> been in the "Jaguar Lab" and had seen a prototype in action.

Didn't the Jaguar originally start life as the Panther? I'm
not sure if Atari was working on two projects at the same time
(Panther & Jaguar) and decided to drop the less advanced model
in favor of the more promising system, or if they figured that
the Panther wasn't sufficiently impressive so they backed-up
a bit and re-worked it into the Jaguar. The only reason I
bring this up is because several developers, most notably
Jeff Minter, have publicly claimed to have done a little
programming on the Panther (I think Minter said he wrote
some demos for it). One of the video game magazines,
possibly the ever-reputable EGM, even published an alleged screen
shot from one such demo. More fuel for the fire...

That sounds like an educational discount price to me... at least you would have to add the keyboard to that.

> Well, Users with an ATARI normally use the Music/Midi advantages,

Right, but a midi i/o box for macs with one in, four outs, and a thru is $50, hence irrelevant.

> or the
> graphical ones (DTP, etc.).

This makes no sense. A Falcon has zero DTP advantages over a Mac. Show me Quark Express, Pagemaker, and Framemaker on a Falcon. Reality check - let's talk facts, not engage in mindless Atari cheerleading. People want to make up their own minds, so they need facts.

> So the DSP is an absolute need for simple HD-IOs,

The word "so" here is incorrect since there was no proof before.

> if you want to make HD-Recording in excessive ways, you can easily
> connect some peripherial recorders. This is much cheaper than any other
> system!

Right, the Falcon is good for hard-disk recording. Big bloody deal. That sure is a big market. Like Amiga's stupid "desktop video". These are extremely small niche markets. Great if you own a studio. I don't.

> Second, the graphix: The falcon easily can make up to 1280*960, even more for
> less than $100, have you ever tried that on a MAC? The lowest prive for a card
> like that on a MAC including the monitor is >$4000, if you want to work with
> it!

This is total utter bulls**t. I can't let this comment pass unchallenged. You obviously have no idea what you're talking about. As the resolution goes up, the number of colours and the vertical scan rate GOES DOWN. The Mac vertical scan rate at 832x624 and 1024x768 and 1152x960 (for higher-end Macs) is 75 HZ!!! Non-interlaced! At >=256 colours. Show me that on a Falcon. It's called bandwidth, and the Falcon doesn't have it. All these hardware hacks that get higher res DROP THE SCAN RATE way down and eventually resort to going interlaced. Macs are NEVER interlaced. You're comparing apples and oranges,

but then you don't understand video anyway.

> I think, that anyone who needs a fast, good computer should buy a Falcon, the
> Desktop-case from DDD, BlowUP030 and maybe the 36Mhz030/50MhzDSP-card, then

Ha ha so how much does that cost? You just contradicted your own argument.
That would then be much more expensive than a Centris.

The Falcon is a nice machine, but my point is the Macs are now very
attractive - powerful, cheap, and tons of software. Let people have the
facts and then make up their own mind. The Falcon at its price point is
expensive and slow, and the DSP is not a general solution, but a specialized
co-processor with lots of limitations.

I got a PD one, PSSED, from a PD supplier in UK a couple of years ago.
Runs in medium res on a 520ST or higher.

There are also program around for loading /saving the sequncer memories
but I never bothered with those (use atari for sequencing).

btw it is possible to produce voices via MIDI editing that it is IMPOSSIBLE
to create from the front panel alone. Not all parameters are accessible
from the front panel. OK so its only 2 op FM, and 8bit or similarly grungy
resolution, but when I was using the PSS I managed to get a few 1/2 decent
bass sounds (much better than presets).

|>>I would prefer an ST version but if there is one for the amiga I would look

|>I wanted some info (several years ago, though).

Absolutely. If you look at the back of your PSS-480 manual it describes
all the parameters for sound dumps etc. The level key scaling feature is
particularly useful if you don't have velocity sensitive MIDI controller.
```

But I'd suggest getting PD programs. If you have any problems email me.

The Conner drives do NOT work in the Mega STE, since parity can't be disabled.
Also "no go" are: Quantum ELS and Maxtor 7213.
Great are the Quantum LPS drives.

992. Factual Information on the Atari Jaguar, Direct From Atari.

Newsgroup: comp.sys.atari.st
Date: 1993-06-24 20:05:14 UTC
From: funkster@cats.ucsc.edu
Message-ID: <20d1dqlNNk4h@darkstar.UCSC.EDU>
Source record: 204170
Cross-posted to: rec.games.video,comp.sys.atari.st

Greetings.

I don't normally read rec.games.video, but since I got a copy of the Atari press release concerning the Jaguar I took an interest in reading about it. I'd hoped to get a little more detail; after all, the press release is noticably sketchy on details. But after reading the ensuing conversations, ranging from wild speculation to "It's just a HOAX, and I'll tell you WHY", I got a little fed up and decided to take matters into my own hands.

At the top of the press release was
For further information:
August J. Liguori
(408) 745-2069
I called Mr. Liguori's office, and left a message for him saying I was calling on behalf of UseNet readers and wanted to kill some rumors.

I received a phone call back this morning at about 11am from one Bob Brodie, Director of Communications at Atari Corp, saying that "Auggie has asked me to return your call" and finding _anyone_ calling on UseNet's behalf humorous. He said he used to maintain a presence on UseNet a while back, but seemed pretty burned out about it, calling UseNet something like "a perpetual state of anarchy". This is why Atari mainly sticks to the pay services such as Delphi, CompuServe, and Genie.

I mentioned to him early in our conversation the theory about the Jaguar being a hoax -- this didn't seem to suprise him. (It was more just a gentle reminder of what UseNet is like, I suppose.) He said that yes, Atari has been known for vaporware in the past, but the Jaguar is a real product, and he spent the rest of the phone conversation reassuring me of this point.

The most compelling statement he made was that the hardware is _done_ and physical Jaguar units _exist_. In fact, there are over 30 development units out in the field, and all of them include a real Jaguar. He said a gentleman from Handmade Software in the UK posts regularly to CompuServe who has a Jaguar and, um, I'm guessing doesn't tell anyone anything because he's probably under a non-disclosure agreement that mentions the electric chair several times.

Mr. Brodie also wanted to make the following specific points:
* Yes, the Jaguar is really a 64-bit processor.
* Yes, the Jaguar's processor is a RISC processor.
* Yes, the Jaguar has RAM internally. (He had seen a rumor that it didn't, and wanted to kill that one right off the bat.)

Now, I figured he wouldn't stray too far from the press release; after all, they were free to put specifics on the Jaguar in there, and they certainly didn't. So I didn't bother to prepare much in the way of specific questions, which was probably just as well because he wasn't willing to answer much. (All the things Mr. Brodie said above were said with hardly any prompting.)

I did ask the following two specific questions, to which I got the following specific answers:

1) Is the external data path of the processor actually 64 bit?
I don't know.
Well, would you tell me if it was?
Probably not. That'll be on the spec sheet when it's released.

2) Is there a graphics coprocessor, and if so, to what degree does it perform coprocessing (3d shaded polygons, for instance)?
No comment. Wait for the spec sheet.

After question 1, he went on to kill the three rumors above (the three items in a bulleted list above). After question 2, he went on to extemporize on the sorts of things the Jaguar could do, mainly concerning realtime manipulation of high-resolution digitized images. This would, for instance, let you play "Joe Montana Football" (a cartridge for the Sega Genesis) but with a real picture of Joe Montana staring you in the face, rather than the "crude" and blocky representations the Sega is capable of.

He said that if any full-time software companies who read this are interested in becoming registered developers for the Jaguar (no "hobbyists", as he kept mentioning; he wanted "real" developers), _please_ call Atari. The Jaguar development kit is $9k and readily available. And it includes a Jaguar, in the flesh (or silicon I suppose), and probably a "minimal run" of Jaguar cartridges, which he mentioned were very high capacity.

Finally, he gave me an email address, and said it was fine to include it:
bobbro@delphi.com
By saying so, both he and I knew he'd be getting mail from the UseNet community asking questions. But he's a busy guy, so let me intervene on his behalf:

Please don't waste his time with questions you know he won't answer, or questions you already know the answer to but want reassurance on.

For instance, asking "Does the Jaguar have a graphics coprocessor that's at least as good as the Super F/X chip?" falls under the first part; he won't answer that. You should already have an idea of what he will and won't answer, based on the press release and what I've said above. (And it ain't much, so far, but that's par for the course in this industry.) Asking "Does the Jaguar really display 16 million colors?" falls under the second part; yes, and it's in the press release, and they didn't go to the trouble of paying for a press release just so they could lie.

On the other hand, if you _do_ mail him with something not covered in the above, and you get a real answer that the rest of UseNet would be

interested in, please feel free to post so that everyone else sees it and someone else doesn't have to ask that question again. Perhaps someone would be willing to start a Jaguar FAQ (Robert Jung, are you listening?) which would aggregate factual data about the Jaguar.

I haven't been an active poster concerning the Jaguar, and I don't plan on becoming one now; I just have a soft spot for Atari, and didn't want to see them unnecessarily badmouthed. But please don't mail further questions/flames/whatever my way. I've posted everything Mr. Brodie told me, and am not planning on contacting him again.

Me, I'll just patiently wait for that spec sheet.

You might want to tell atari that they have made YET ANOTHER marketing blunder...whether they LIKE usenet or not, _alot_ of people read Rec.Games.Video, and you dont get ANYWHERE by insulting them! I am on GEnie, BTW...representation my ASS. They are there(one guy has an account on the 3 nets...:), and he's a game tester. I can give you a quote i've heard around 30 times. "Sorry, nope, have a NON DISCLOSURE AGREEMENT"...gee, what a GREAT way to build hype. Man. Awesome. In the first use of this word that is warranted...what a putz. (You guys even know what a putz is?)
Later,
Gasman

P.S. This is, in all intent, a flame. I do not appreciate being insulted. Before, I might have even LOOKED at the sucker. Now it is personal. If you speak to the gentleman who said this, I want you to tell him Gasman reminded him not to bite the hand that feeds them.

P.P.S. Rec.Games.Video.* is a lot bigger than Atari might think...one kid reads a post on RGV.Nintendo about HF, next day a whole school knows about it. But atari is too stupid to know that.

P.P.P.S. Note: The atari lynx SHOULD be the best portable.

>You might want to tell atari that they have made YET ANOTHER marketing
>blunder...whether they LIKE usenet or not, _alot_ of people read
>Rec.Games.Video, and you dont get ANYWHERE by insulting them!

I don't think Bob intended anything insulting by his remarks. In fact, I think "perpetual state of anarchy" is a pretty accurate description of Usenet, and I for one think that's one of Usenets advantages (most of the time... there are certainly times when the anarchy can be frustrating, though).

Atari is a very small company these days. We do what we can, but I can understand why Bob finds it necessary to restrict himself to the pay services; there just aren't enough hours in the day for him to be on-line on GEnie, Compuserve, Delphi, Prodigy, Usenet, and the various BBS networks. If he had the resources, I'm sure he'd spend more time on Usenet. As it is, he basically has chosen to focus on GEnie and (to a lesser extent) some other pay services. Note that most Atari activity on GEnie is conducted in the Atari computer forums, since at the moment Atari Computer Corp. is not a big player in the video game market (the Lynx is our only product there). No doubt that will change once Jaguar is released.

Finally, just a general meta-comment about the requests for information. Yes, I can understand why everyone is eager to find out more about Jaguar. But honestly, until there is a real product available, any system is just "vaporware" and all the marketing hype in the world is essentially useless. It's only *after* there is real, available hardware that anyone should take the hype at all seriously, because only then can you actually test the system. That applies to 3DO as much as to Jaguar (probably more, since they've been generating much more hype over just as much product, i.e. none -- at least, none that a consumer can see).

BIG DISCLAIMER: I work for Atari, but I definitely do *not* speak for Atari. All opinions expressed above are my own. I do know about Jaguar, but I'm under a very strict NDA, so I can't answer any questions about it. Finally, don't bother flaming me about Atari's marketing strategies;

I have nothing at all to do with marketing.

For god's sake, it's not a "trap." I am not out to "get" you, Atari,
or anyone else. As for fear of NDA's, anyone can email me or
anonymously upload information about the Jaguar to ftp.ai.mit.edu in
pub/dmb and I will post it here. Anonymous stuff has less credibility
than if sent with a name attached, but is better than "I heard XYZ" or
"I know someone who says PQR." I'd like to see information from
someone with the machine. I'm sure many people reading this group
would be interested in that.

Man, ya gotta love Bob Brodie. What a guy. Usenet's not good enough for Bob; only 10 million people reading it from the entire civilized world. BTW, Bob Brodie hasn't posted a note (to comp.sys.atari.st, at least) since before 1986, if ever. I don't see how just reading is "maintaining a presence," but whatever...

If Bob *were* on Usent, however, I'd be interested to hear what he thinks about the fact that Usenet considers him calling someone on Atari's behalf humorous... :)

>He said a gentleman from Handmade Software in the UK posts regularly

ONLY if it has enough RAM for Joe's digitized image, though! How much RAM does it have?!?!?! How big are the carts? The limitation with the SEGA is that carts are 2MB and smaller. :|

>The Jaguar development kit is $9k and readily available. And it includes a
^^^
Competitive with 3DO.

>Jaguar, in the flesh (or silicon I suppose), and probably a "minimal run"
>of Jaguar cartridges, which he mentioned were very high capacity.

^^^^^^^^^^

That's potentially bad news. Carts are enormously more expensive than CD's. It would be nice to know if its capable of handling CD-based games as well. If not, I doubt that developers will really embrace it in the face of the buck-a-disk reproduction costs for 3DO CD's. This is one problem they need to fix soon if they want to compete with 3DO and SEGA (both of whom have CD-based systems now).

>I just have a soft spot for Atari, and didn't want to see
>them unnecessarily badmouthed.
^^^^^^^^^^^^^^^^^^^^^^^^

In the context of Atari, what an oxymoron that is. :)

The Falcon directory was locked by accident during a recent round of housekeeping activities a day or two ago. I've just repermitted it. Sorry for any inconvenience...

Gee, just browsing through the net and see myself referenced. Strange sensation...

I suppose, if more information about the Jaguar were available, an FAQ would be a good place to dissiminate data. Problem is, at this point in time, the only thing solid is "Atari is working on a game machine called the Jaguar". There's been nothing else I've seen from a reliable source that can be worth sticking in a rumor-dispelling FAQ.

Nice idea, tho.

>If you can not find the sources send me email and I'll send them to you.
>I do not plan on posting to the archive until the next version is complete.

Hi Brian,

That sounds logical enough -- except that I'm using an STe.

I don't know how I got ahold of your program, but maybe this will help.
The size of the file I have is 18140 (bytes). If the original is
not this size, then I have a bad copy. This is my guess because it
behaves rather strangely. Also, the source was not included in the
archived file. And if it were, I wouldn't know how to read it anyway.

For now, I'll just try to convert the sounds to another format with
"525" - which I recently found on the a.a.u.e.

Also, here's a tip for ST users. WAV files CAN be heard with a normal
sound player, like Sound Lab, for instance. I'm not sure if they're
exactly clear or not since I've never heard the WAV samples on a PC.
You may have to hunt for the correct hertz rate, but they do turn out
pretty well. I'm going to check out the WAV converter and see if
they turn out any better. I'll follow up with the results.

Oh, and I HIGHLY recommend Sound Lab. I'm going to register this gem
as soon as I can. It's one of the best sound programs I've seen
anywhere.

>Get Diamond Back II. It's great. Highly recommended.
>

I was disapointed with diamondback II. I have lost files with it although
it may have been my fault. (the target file system was screwed up)
Incremental backups are difficult. it uses the archive bit or a date
instead of comparing source files to the target files (or a listing of
files in a backup) to determine what to back up. It does not support
flopticals except as another HD partition.

The backup utility I mostly like is called "Good". the problem is the
developer is no longer supporting atari and Good does not
support flopticals. I tempted to try gnu tar for multi-volume backup.

I've spent more money on backup utilities than I care to think about!!

1002. PLEASE help me with LPMUD for Atari ST

Newsgroup: comp.sys.atari.st
Date: 1993-06-25 04:13:15 UTC
From: hines@acad.mwsc.edu
Message-ID: <20du0r$m0s@parsifal.umkc.edu>
Source record: 204196

I found an LP mud for my atari, but All I got was the C source code, and
I have NO idea where to BEGIN compiling it. Can someone please help me?
The file is called dr312a.zoo (the atari specific part)
and lpmud.3.1.2.c.atari_and_others.zoo (a general part)
the files are quite large, and there are many of them.
Any advice/hints that anyone can give me would be GREATLY appreciated!
This software appears to be a port of a guy named Amylaar. I know there is
an Amiga version out there (I have a friend who has it) and probably
versions for IBM etc.....
I am experienced at a little C programming, but not in the gnu-c enviroment.
In fact I cant even get my gnu C to work yet.
So, if someone knows of a ftp site I can get the compiled version, or if you
have it and can send it to me, I would just love it!
I have a 520 ST with 2.5 Meg, a color monitor (soon to get multisync), and
65 Meg HD.
Thank you for reading my message!

To Graeme Rutt:

An interesting note is how much Atari brass has been talking up the notion that there will be a marketing blitz for the Jaguar. As I stated before, I believe a Feb. issue of the industrial edition of BusinessWeek stated that Atari had a $12 million advertising budget for the Jaguar for That sounds pretty low, but that would be maybe 3-4 months worth.....not bad really! We'll see...

All I know is that there has been a lot of talk lately about an "expandable" (disk drive, keyboard) Atari console. Coupled with the quote from a German Atari official that there would be more than one console released this year, and I begin to wonder what is up Atari's sleeve. if I find out anymore, I'll be sure to let you know.

- Chris Millar

1008. Re: GREAT! Another Atari grouch

Message-ID: <20e28i$sf0@usenet.INS.CWRU.Edu>
Source record: 204184

According to Richard Miller, I believe, both projects were being
worked on simultaneously. When the Panther was ready to be launced
Atari took a good look at the market and said, "Nah, we want something
spectacular....not a 'me, too' machine." So they devoted all further
efforts to the jaguar project, which was much further along then they expected.
Word is that Jeff Minter did the "polygon flight simulator" demo on the
Jaguar......just a rumor, though. <G>

You are a _very_ ignorant man. The Jaguar project has been
in existence since 1990 - long before the 3DO project was even
a glimmer in anyone's mind. The project's intention was to
manufacture and design a 64 bit RISC CPU - it is done, and
^^^
is being manufactured. There is much more than a "prototype"
^^^^^^^^^^^^^^^^^^^^
in existance. Many developers are in possesion of development
machines, and Atari has a "Jaguar lab". The reason that Atari
only showed a video tape of certain Jaguar derived effects was
because the date between the CES and the introduction is on the
factor of several months - why waste a great deal of money
hyping a machine that will not hit the shelves for maybe half
a year?

Perhaps if you would look at facts, and not rely on your own
illbegotten suppositions, the truth would become apparent.
Unfortunately, you are far too stupid to do that...

- Chris Millar
--

I figured I'd just repost the whole thing so you could experience the full-bodied flavor of your own post first-hand. BTW, don't put your foot further in your mouth by claiming I forged that posting. There are plenty of people who can corrborate, and this group is attached to a mailing list, so your wonderful posting has been archived at thousands of sites around the world.

> It seems as though you have a great deal of unresolved personal
> problems...But I find it wholely unnecessary for you to blow
> steam off here, or at John. See a shrink for that, or go see
> a close friend.

Quite an attitude you've got there. Yes, YOUR post was a model, and I should have followed it. John's was really quality stuff too. Why don't you both stop trying to portray me as something I am not and engage in some intelligent discussion? Or have you just decided you can't argue with me so you have to mudsling? I guess I'm not surprised if that's the case; neither of you has posted anything but unsubstantiated rumors and trite banter here yet.

This whole thread is completely pathetic. I posted a restrained response to John's little personal dig asking for a bit of understanding -- asking you not to typecast me and to leave Game Workbench and these supposed "personal problems with Atari" out of it for a change -- and you turn around and do exactly what I asked you not to do! Are you *trying* to piss me off and start a flamewar?! Was there any point to your post here, or were *you* just "blowing off steam?" Or perhaps trying to salvage the lousy position you've put yourself in?

> Oddly enough, the word on the street is that the Jag is _more_
> powerful than the 3DO...believe what you want, but I'll be more
> than happy to accept your humblest of apologies at the end of this
> year.

My "humblest apologies?" Man, you are one arrogant son of a bitch. Get with the program -- this may be Usenet but you can't expect to lie and treat people like shit (as in the above message) without being taken to task for it. Would you say this kind of thing to my face? How about the filth you dumped on that poor guy in the message above? Want to start taking responsibility for any of this some time?

You posted what I suspect is complete garbage about the Jaguar, and flamed someone for not believing it. Now that I ask you to come up with some sources to substantiate your bluster you puff up and start theorizing about MY personal problems. You must be Sinclair-Day's evil twin brother...

>Until then...lighten up!

Take your own advice, pal; I've been happily interacting with people here since years before you showed up. And if you think telling someone they should see a shrink is "light," *you* need help.

Every time I post a reality check here to counter the Cheerleaders and the Sinclair-Day's, idiots like you and Atari Zealots like John make personal attacks and start a massive flamewar. Live in ignorance if you will, but don't waste everyone's time with this religious crap over and over and over again.

We're talking about computers here, kids. Just computers. Remember?

A 3DO player is about $700 dollars don't forget. (Yeah, and Panasonic says
it'll be $500 by the end of the year)

>>Jaguar, in the flesh (or silicon I suppose), and probably a "minimal run"
>>of Jaguar cartridges, which he mentioned were very high capacity.
> ^^^^^^^^^^
>That's potentially bad news. Carts are enormously more expensive than
>CD's.

As an example, why are PC CD-ROM games more expensive than the HD installible
counterparts? Cuz more work has to go into them so the consumer thinks they
get their moneys worth.

So while a typical CD-ROM game costs 89.95, a cartridge costs $49.95

Just how much of the 660Megs of a CD ROM is really used?
My point is that while CD-ROM's are cheaper to make, won't the cost of
'filling' the extra room compensate, and raise the price of the product
in the end?

Something else to consider, do you want 9yr old Bobby 'throwing' a CD
into the player?

On the other side, you don't have to make CD games that appeal to little
bobby.

> It would be nice to know if its capable of handling CD-based
>games as well.

A player is mentioned in the PR, it will read PhotoCD as well.
(and some other formats... I forget)

Atari has the rights to use CinePak, 320x200 TC animations with sound
at 30fps, off a CD-ROM in real time.

> If not, I doubt that developers will really embrace it
>in the face of the buck-a-disk reproduction costs for 3DO CD's. This
>is one problem they need to fix soon if they want to compete with 3DO
>and SEGA (both of whom have CD-based systems now).

the 3DO exists as much as the jaguar does then hmm? (developers only)

That SegaCD drivel is junk, ever see 7th guest? THATS a CD-rom game.

It look's like I need to make the trip to atari again, Hey eric, can you
let me upstairs into the forbidden area? I'll sign my soul away.

In all honesty, I would like to see Bob Brodie attempting to revitalize
Atari user groups than spending all day on online services.

It is nice that I can write him and he replies, but anyone can do this.
Not everyone can organize Atari user groups.

Besides, it isn't healthy to use a computer all day long... especially
on online services!

That's bullshit. Atari would never get the Jaguar out the door for
less than $400 if they included a CD-ROM player.

And since Bob Brodie said that the cartridges would be priced similar
to SNES and Genesis, I don't see what the big deal is about.

Oh, Bob sent me private e-mail concerning the price of cartridges which
everyone was asking about. They won't be like NEO*GEO cartridges.

I think having the Jaguar cartridge based with the option to add a CD-ROM
player is a good idea. I read somewhere maybe in the 1993 Annual Report
that a CD-ROM player will be able to connect to it.

Well, both programs work fine together, when you compile mint with 2 corrections. If not, you can also use MiNT/MultiTOS with OUTSIDE, but you can get sometimes problems, but compiling MiNT is easy. When I get into MiNT-mode, I always use OUTSIDE!

Greets, Roland

What a load of absolute Rubish, the Lynx was going to kill every thing,
but from what I have read here and seen in New Zealand they can't even
give them away.

Atari has lost it creditability many years ago, the only things that were good
was the ST back in 1985 and the Mega, nothing else has survided, and from what
we see here even the Falcon is a big flop, why would I go buy a Flacon and find
that most 80% of my software collection will not run, so Please tell me
what is the point in that, there is No Software and no Support or Service,
or should we say that the Falcon has the three SSS....

There is a saying that Atari has lost its Bottle..

So come on Chaps stop dreaming, Atari is a Bottle less company...

I think they should just put there Name to Acorn Archemides computers, at least
they are pushed here in a Big way, even more than Amigas...

Yes a English 32 bit RISC machine that is as old as the Atari, well all most,
and can Multitask, and has a nice G.U.I interface, will leave Amigas
for dead..

There RISC chips are used by Apple in there Newton machine..

Roger..... sheppard_r@kosmos.wcc.govt.nz

1018. How to get AEO automatically?

Newsgroup: comp.sys.atari.st

Is there a way to get AEO automatically every second week? Can one subscribe it via any server?

It's really boring getting it three weeks late via ftp from a.a.u.e

Thanks for any info
--
Harald Schoenfeld (IRC Nick: Equinoxe) | I'm sorry Dave,

Send me email at work (herborth@polo.waterloo.ncr.com) and I'll happily
send you the source code (compiles VERY easily under GNU C, almost as
easily under Pure C/Turbo C).

Email me and beg for an ST executable. Over a year ago I compiled it
and contacted the POV Team; I'm still waiting for permission to upload
binaries somewhere.

Use Archie; he'll tell you where to grab a full POV-Ray
docs/samples/source archive (somewhere at ucarleton.ca is a good place;
David Buck, author of DKB Trace is hosted there).

Well, the game system to computer hasn't worked and it wouldn't work.
I have had the intellivision computer add on, the Colleco adam add on and
a few cross betweens like the Spectra and Aquirous. They are always less
computer than you need and mostly useless. (although the adam was my computer
for 3 years)

Anyways, the console I would love to see but it would be a bitch to get
the copy rights and probably cost too much.
A consoled that would run, Atari 2600, Atari 5200, Atari 7800, Itellivison
and Collecovision carts. So I can put all my others in the closet and have
just one unit on my desk. I don't think this is impossible.

I've used a Falcon - although I don't yet own one - and your figures
are incorrect. Of the serious software I've used maybe 80% run on the
Falcon (and maybe 20% of them have slight glitches that don't really
cause a lot of damage). Of games software then maybe it's 40% that run
- but this can be raised to maybe 60-70% by the use of Magi or
Backwards two 'fix' programs that work very well.

>Dave Baggett

Yeah, okay, so maybe I was a little unfair with the above but after reading some of your previous postings can you honestly say you wouldn't have commented adversely if I had of quoted NDA and let it lie there?

Okay, so I did speak to a guy who said PQR, and he told me not a lot more than appears on the Jaguar press release - but the guy is a developer, has a devlopment machine and could *verify* what was on that release. This has to be better than nothing - and I for one wouldn't expect anyone to break a NDA. And the idea of anonymous postings - well, I find that a bit low - you're still asking people to break contracts.

However, I find it lower of Atari to make these guys gag themselves to the hilt over such trivial matters. Do they really think that if it was generally known that the Jaguar had a specially made graphics co-pro that this would make Sega go out and plug one into their latest machine? Probably - oh well.

>>Competitive with 3DO.
>
>A 3DO player is about $700 dollars don't forget. (Yeah, and Panasonic says
>it'll be $500 by the end of the year)

I was talking about the development system price, but even so, the 3DO consortium has been quoting lower prices than $700. Initially they announced that price, but realizing it was a bit steep they've scaled it back. I don't know what the current story is on that it, but if you call the consortium they'll tell you.

>As an example, why are PC CD-ROM games more expensive than the HD installible
>counterparts? Cuz more work has to go into them so the consumer thinks they
>get their moneys worth.
>
>So while a typical CD-ROM game costs 89.95, a cartridge costs $49.95

That's mainly an issue of perception in the *computer* games market. They'll sell the games for what they can make, and CD's still have some special mystic that's worth more money. Many PC games on CD-ROM are the same as their floppy-based counterparts. Sometimes they include special add-ons, but not always. But the *duplication* costs aren't the same as the costs charged consumers. I'm talking about developers, not end users.

It's certainly not the case that you have to fill a CD for people to buy the game. Joe Montana football, with the same graphics and sound, will be cheaper to produce for the 3DO than for any cart-based machine, because the duplication costs are much lower.

>Something else to consider, do you want 9yr old Bobby 'throwing' a CD
>into the player?

I dunno; that age group probably has plenty of music CD's and no one's complained. But carts probably *are* more durable, for what it's worth. I doubt such concerns sell machines though. I think what sells machines is hot licensed titles with spectacular graphics and sound, regardless of playability, durability, etc. We know that Jurassic Park is an upcoming 3DO title. We also have reports that Dan Bunten is working on "Son of Mule" for the 3DO. These kinds of things will sell units. It's not *just* the hardware that matters.

Atari needs to be there in September with arcade translations, movie titles, etc. If they miss that, and especially if they miss Christmas, the Jaguar will (IMHO) be DOA. My concern is that Atari will blow this

opportunity, just as they've blown the Falcon opportunity, and then they'll be right back where we were two years ago -- with nothing that sells.

>On the other side, you don't have to make CD games that appeal to little >bobby.

You can do any game you want and put it on CD, and it will be cheaper to produce than the same game for SNES on cart. You're arguing that because the capability for doing *more* is there, you *have* to use it, which is not the case. I'm talking about the simple fact that mass producing CD's costs less than a dollar a disk, while mass producing carts costs $10-$20 each. That's a huge difference, and the media cost comes right out of profits.

CD's are better and they're cheaper. It seems somewhat paradoxical, but the situation exists because music is distributed on CD now. If music were distributed on SNES carts, there might be a different story. :)

>A player is mentioned in the PR, it will read PhotoCD as well.
>(and some other formats... I forget)

Well, if I were Atari, I'd really focus on the CD player. They really need to do that to survive in what will be an even more competitive market come September when the 3DO is released. (And who knows what Nintendo is up to.)

>the 3DO exists as much as the jaguar does then hmm? (developers only)

Well no, the 3DO has been shown at shows like CES, while Atari doesn't consider it worth their time to show anything but a videotape. No one outside the developer community has any evidence that Jaguars even exist. (Not that I'm claiming they don't; I think some prototypes are out there.) Atari is hiding from the world, while 3DO is being fairly forthcoming (and of course marketroidy) about the details of their machine.

>[SEGA-CD sucks]

Hey, a CD is a CD. All it means is lots of data, accessible at a fairly slow rate. I agree that SEGA has not exploited the potential of CD's, but that doesn't mean that the hardware isn't capable of doing wonderful things.

>That's bullshit. Atari would never get the Jaguar out the door for
>less than $400 if they included a CD-ROM player.

Len, it doesn't matter if they get it out the door if only a tiny
number of developers want to develop for it.

>And since Bob Brodie said that the cartridges would be priced similar
>to SNES and Genesis, I don't see what the big deal is about.

Maybe he thinks they'll be priced the same for *end-users* but it is
simply NOT the case that bigger carts will costs the same as SNES and
SEGA carts to *manufacture*. Not many SEGA games are even 2MB because
of the cost differential between 1MB and 2MB carts.

Do you think a 32MB cart is cheap? 16MB? He did say "very large,"
whatever that means. 32MB *SIMMS* is more than the price of a standard
cart! Bob is either lying or misinformed about the technical details
of what he's saying.

The point is that if the Jagaur and 3DO markets are similarly sized (in
the long run), developers will favor the machine they can produce games
for the cheapest, because that way they make the most money. If the
difference between cart costs and CD costs weren't so vast, the
argument wouldn't be as persuasive. But ask anyone in the business
about cart costs vs. CD costs and they'll tell how much capital getting
into the business of making carts requires. On the other hand, you can
get a complete 3DO development system *and* your own (slow) CD
mastering machine for $15K.

I understand why NDA's are invovled; it's just that dangling a carrot in front of us and then saying, "Oop, can't tell because of the NDA" is just silly. If I sound hostile, I am not. I only get hostile when people start making personal comments, which you have not done. (Thank you.)

>This has to be better than nothing - and I for one wouldn't expect
>anyone to break a NDA. And the idea of anonymous postings - well, I
>find that a bit low - you're still asking people to break contracts.

The reason I'm pushing this point so much is partly that I know Atari has been sloppy with NDA's in the past, which means there may very well be someone out there who has the machine and hasn't signed an NDA. I learned all about the Falcon, saw the prototype, played with it, and got a close look at the chips under the hood last summer when it was hot news, and I had signed nothing, much less an NDA. I didn't post about what I knew because I didn't want to screw them, despite how obnoxious they were. (See, I'm not *totally* heartless. :)

>However, I find it lower of Atari to make these guys gag themselves to
>the hilt over such trivial matters. Do they really think that if it

Atari can do everything in their power to prevent information from getting out, and the user community and the press can do everything in its power to get a developer to tell us what we want to know. Morals aside, there's nothing illegal about either.

For sale, Microvitec CUB COLOUR MONITOR.

I can supply the relevant cable to attach it to any Atari,
Commodore, PC etc etc. Will connect to most computers. RGB
analogue or TTL. Good picture, I use one myself and
I've got one spare.

If you want to use it with CUBASE or similar high resolution
software, I can supply a Public Domain mono emulator accessory
that gives you a very useable picture on a colour monitor.

If you play a lot of games, a monitor like this could
definately help improve the health of your poor eyes...

Delivery within a reasonable radius of Peckham or Ladbroke Grove
can be arranged free of charge.

50 pounds, including cable and
delivery, or nearest offer.

Now you can't say fairer than that, can you.

Leave a message on 081-693-2846 and Ill get back to you
as soon as possible.....

You think Jaguar will kick 3DO's ass, bullshit.... What makes you think that the Jaguuar will be successful in the market place? Atari had the Lynx and it blew away the lame boy technology wise, but lame boy sold more due to superior marketing. You think the Jaguar will be any different.

Oh, Come on Chris. I think John is right on. I heard all this B.S. about how the TT was gonna "revolutionize" computing. Then the same thing was said about the Falcon. Here's a machine that was supposed to be out en masse months ago. And to this day, there still seems to be only a dozen or so real live, honest to goodness Falcon owners. A couple postings ago you asked John to give Atari a chance. Haven't Atari users been doing that for about 6 years now? The original ST was revolutionary when it first came out. It had a lot of bang for the buck. But since then, Atari really hasn't seemed to be able to recapture the computer users' imagination in the quantities they did back then. Atari seems to ALWAYS be announcing wonder-products that arrive too late in too small quantities to really be thought of as successful product development and marketing.

Why is it unreasonable for John to be pessimistic about ravings on the USENET feeds? I've been reading that same kind of stuff for two years here, and many more years before that on GEnie and BBS systems. Rarely, in my view of things, has Atari actually delivered a product that truly lived up to the claims of their propaganda reps or the hormonal

Online message posters. Remember the Stacey? Remember the ST-BOOK, or
Atari Unix? How about the ATW Transputer, or the MS-DOS clones? At the same
time as the ST Book was raving about a hand recognition stylus type computer
by Atari. Yup. Other companies are actually MAKING that kind of stuff
now. Like John says, with such an awful track record, how can anyone
be enthused by yet another round of unsupported claims. Of course,
I know Atari isn't totally alone. There was the Apple Lisa, the
IBM PC-Jr., The Apple III. Atari just seems to have more than its
share of coughs, sputters, unrealized fantasies, and vaporware.

Jeff - "Moonlight WorkShop", Atari Classics Magazine.

From: stephan@nats.informatik.uni-hamburg.de
Message-ID: <stephan.741024352@nats1>
Source record: 204059

willoch@oslo.sgp.slb.com (thorbjorn willoch) writes:

Hello Thorbjoern !

>How do I get the software from my Sun to my Atari?

I use dosmount to mount the floppy onto a directory. Then I
can use `cp` to copy the files on the floppy.

`strings dosmount` shows me:
"@(#)mntdisk.c 1.00 91/07/02"
"@(#)funcs.c 1.00 91/07/02"

>What kind of floppy format does the Atari use?

The same as Microsoft or DR DOS. The new ataris have a
high-density (1.44 MB) drive the older ones only double-density
(720 KB).

I use a high-density drive.

>Can it read PC-format?

Yes. But not necessarily the other way round.

>Does there exist programs to write Atari format on floppys from UNIX?
>Can rawwrite be used?

I dunno. What is `rawwrite`?

Bye.

Has anyone got any more information on the purported Falcon rackmount
version? I believe it was to be called the Falcon PMW or some such...

Or is it going to go the way of the 1450XLD...

that would be too bad...

.s.
(maybe I'll email Bob for some information...)

Hello there,

Does anybody out there know the memory location (ie start & end) of
TOS 1.02 . Or even better, does anybody have a memory map
for the ST that includes this (and hopefully other information) ?
I'm interested in hacking around in it and generally having a play !

Many thanks,

Danny

>Dave Baggett

I've only ever had to sign a NDA once (strangely enough for some development work on the (then) yet unseen SNES) and admit to knowing little about them. But, don't they constitute a legal contract? And therefore the breaking of them - even anonymously - would put the devloper in breach of contract. And therefore they could be sued in a court of law?

ATB,

1039. Vintage ST for sale cheap

Newsgroup: comp.sys.atari.st
Date: 1993-06-25 19:25:18 UTC
From: Michael Paul Greelish <mg20+@andrew.cmu.edu>
Message-ID: <lg_p4Sy00VAuEE9Uk4@andrew.cmu.edu>
Source record: 204066

For sale, $400 with printer, $350 without, plus shipping (if any):

Atari 1040ST computer, with 13" color monitor, printer, mouse,
joysticks, and tons of software.
Very similar to an Amiga 1000. $470 cheaper than a student-discount Mac
Classic II, and it comes with a printer, COLOR monitor, and loads of
software.

Specs:

Motorola MC68000 processor @ 8MHz. Fast as a Mac Classic or SE, or a '286 PC.
Available adapter (Spectre GCR) to run Mac black and white software.

1 Meg RAM, 192K ROM. TOS 1.0.

1 720K 3.5" floppy drive, IBM-compatible (you can read and write IBM
disks, which means that with the Apple File Exchange, DOS Mounter Disk,
or SoftPC, you can export data [i.e. word processing documents] to a
Mac. Hell, you can even export data to a REAL IBM-compatible with a 3.5"
drive.)

Atari color monitor. 640x400x16 colors, or 320x200x256 colors. Sound included.

Printer specs:

Epson LX-90 dot-matrix with tractor feed. 160 cps draft, 60 cps letter
quality. Boldface, italics, underline, graphics, foreign fonts, the
works. Comes with 1000 sheets tractor-feed paper.

Serious Software:

Word Writer 2.0. PC-compatible word processor. 85,000 word spell
checker, thesaurus, outliner, mail merge, etc.
DEGAS Elite. Way cool paint program.
Lots of utilities (disk fixers, file managers, anti-viral stuff, etc.)

Games:

Falcon 1.3 with add on disk-- Operation: Firefight. Just like the PC
Falcon. Full color 3-D.
Their Finest Hour-- Awesome Lucasfilm WWII air combat simulator.
Populous-- Just plain fun.
Breach 2-- A futuristic wargame where you control a squad of Space
Marines. Much like "Aliens", only YOU control the Marines. Some serious
enemy AI here. Comes with add-on mission disk.
Prime Time-- Parody of running a TV network.
Carrier Command-- An immense wargame. Command an aircraft carrier battle
group against another carrier group. Can take WEEKS to finish.

Other Software:

Lots of 3-D graphics stuff. 2 years' back issues of STart, an Atari ST disk magazine.

Oh yeah:

2 joysticks, mouse, mouse pad, ALL documentation and cabling. Keyboard is built-in.

Reply via email to mg20@andrew.cmu.edu. Thank you.

>Atari user groups than spending all day on online services.

The only way user groups are going to be revitalized is by computer sales.

>It is nice that I can write him and he replies, but anyone can do this.
>Not everyone can organize Atari user groups.

It's not very difficult to organize a user group. I'm not quite sure why
you need Bob Brodie to do this. I just talked with a guy on GEnie last
night who is starting up an Atari user group and he has some pretty good
ideas. Sure, brochures and promotional stuff from Atari would be nice to
get at a user group meeting (and Bob does this anyway if you ask), but how
much more can he do? His time is better spent when addressing the market
as a whole, as opposed to massaging a few user groups.

>Besides, it isn't healthy to use a computer all day long... especially
>on online services!

Hehehe. I do tech support, so all day long I stare at a Mac and a PC.
Guess what I do to relax when I get home? Use my TT. :-)

From: wilsont@rahul.net
Message-ID: <C973JI.9yp@rahul.net>
Source record: 204070

In <20f1q3INN5bh@life.ai.mit.edu> dmb@case.ai.mit.edu (David Baggett) writes:

>That's mainly an issue of perception in the *computer* games market.

it was the only reference I had, I don't know how much SegaCD, or
TurboDuo CD's cost.

>special add-ons, but not always. But the *duplication* costs aren't
>the same as the costs charged consumers. I'm talking about developers,
>not end users.

heck, i'm a 'independent' developer for unix, atari, and (gag) clones,
I'd like to do X and Y, but the market (end users) wants A and B.

CD-ROM's are a heckuva lot slower than carts, will bobby get tired of
waiting for the graphics to load?

Sure, as a developer, I would say: CD's cost less per unit, CD's can hold
all of my sounds and graphics and code uncompressed, great! but if it
turns out that people hate the lag times, a tiny scratch destroys the medium,
and the players are 200 bucks, that makes me take a look at carts again.

>buy the game. Joe Montana football, with the same graphics and sound,
>will be cheaper to produce for the 3DO than for any cart-based machine,
>because the duplication costs are much lower.

Very true, in a straight across port.

>>Something else to consider, do you want 9yr old Bobby 'throwing' a CD
>>into the player?
>I dunno; that age group probably has plenty of music CD's and no one's
>complained. But carts probably *are* more durable, for what it's

Where *I* live, and see the kids scurrying around, none of them have
CD's, they are completely amazed by my CD player. the age where music
becomes more prevailent (my guess) is 13-14.
My cousins just wreck the crap out of anything they touch.

>worth. I doubt such concerns sell machines though. I think what sells
>machines is hot licensed titles with spectacular graphics and sound,
>regardless of playability, durability, etc. We know that Jurassic Park

To me, its very true, but very sad. Flash and wizbang sells. While good
playible games get the sidelines.

>is an upcoming 3DO title.
well, i hear (for real) that Atari Games is porting their arcade lineup to
the jaguar.

JP will probably sell, even though I hate movie-games.

> We also have reports that Dan Bunten is
>working on "Son of Mule" for the 3DO. These kinds of things will
>sell units. It's not *just* the hardware that matters.

I think thats 'Dani Bunten' now, VG&CE editor on rec.games.video.misc told
me about a sex-change rumor.

At anyrate, Software does to the selling, if hardware did, motorola machines
would dominate.

>Atari needs to be there in September with arcade translations, movie
>titles, etc. If they miss that, and especially if they miss Christmas,
>the Jaguar will (IMHO) be DOA.

I'll see what I can dig up about that autumn release date.

>You can do any game you want and put it on CD, and it will be cheaper
>to produce than the same game for SNES on cart. You're arguing that
>because the capability for doing *more* is there, you *have* to use it,
>which is not the case.

Very true, again, it goes back to the 'model' i used, the PC market.
Also, i'm wondering about a 9-13yr olds competence. I'm 21, and i've thrashed
a few of my CD's (by accident), a CD-ROM is not so forgiving as a audio CD.

[media cost comes out of the profits..mangled by call-waiting]

Yes, but if the consumer can't 'put up' with the slow times of the
access, the fragile nature of th i'm just offering up the the other
side of the CD case.

>Well, if I were Atari, I'd really focus on the CD player. They really
>need to do that to survive in what will be an even more competitive
>market come September when the 3DO is released. (And who knows what
>Nintendo is up to.)

Atari isn't really scared about the 3DO (good or bad I don't know)
face it, a 3dO is $500-700 dollars, and the jag is $200, the 3dO isn't really
a pure game machine anyways. (a lot a people make it out to be as such)

>>the 3DO exists as much as the jaguar does then hmm? (developers only)

>Well no, the 3DO has been shown at shows like CES, while Atari doesn't
>consider it worth their time to show anything but a videotape. No one

I've talked to a few atari people about this, i'm gonna write an article
on it soon, but they had good reasons.

>out there.) Atari is hiding from the world, while 3DO is being fairly
>forthcoming (and of course marketroidy) about the details of their
>machine.

Marketroidy, hehhehe, i like that.
Details on the 3dO? I'd like to see them. (i just never have)

>as a whole, as opposed to massaging a few user groups.

Organize Atari user groups as a whole... c'mon Ed let's get with it.
Did you think I meant one user group?

This is what Atari can do, but someone has to organize it:

following:

Atari could take action to revitalize Atari user groups by doing the
following:

o Atari User Group Services.
Organize a department at Atari Corporation to specifically deal with
user groups.

o Build a closer relationship with Atari user groups.
Most user groups receive no support from Atari making it nearly
impossible to continue existence. A relationship is needed to increase
user group members spirit and give the feeling that Atari cares.

o Establish an Atari User Group Information Network.
A Bulletin Board System (BBS) STRICTLY for the exchange of user group
articles, files, and information.

o An Atari User Group Newsletter.
This newsletter would be distributed to user groups and would consist of

articles on what other user groups are doing such as demonstrating Atari products at shows, how each user group runs their meetings, what topics user groups discuss, how they have increased membership, and the number of members each user group has.

The articles would be contributed by user groups and the newsletter could be put together by Atari Explorer staff.

o Third-party software demos.
Any time new software is released, a demo copy of this software would be sent to user groups with over 20 members.

o Public Domain & Review Catalog.
A user group wishing for public domain programs or reviews on disk will be able to purchase them through Atari at cost.

o Free Items to Atari user groups with over 20 members:
International Software Catalog -- A free copy of Atari's International Software Catalog.

Atari Explorer Subscription -- A free subscription to Atari Explorer Magazine. This may even help increase the number of subscriptions.

Flyers and Brochures -- Free flyers and brochures given to user group members to give to their friends and other interested parties.

o Special Deals to Atari user groups with over 20 members:
Falcon030 personal media computer at cost -- A user group with over 20 members will have the opportunity to purchase ONE Falcon030 at manufacturer's cost for display and demo purposes only.

Future product purchase opportunities -- User groups with over 20 members will have the opportunity to purchase any new Atari product at manufacturer's cost for display and demo purposes only.

Developer's Documentation -- A user group usually has many programmers that are interested in programming public domain software. This public domain software will add value to the Falcon030. The cost of this documentation will be copy and shipment cost.

o Atari Co-Op Computer Shows.
If a user group wishes to demonstrate Atari products at computer shows or festivals, Atari will pay half the cost up to $100 a year. Since Atari cannot afford to send people to these shows and Atari user groups are willing to go, why not let them? At most, Atari would pay $20,000 a year to help user groups attend these shows. Apple pays this amount to attend only a few shows.

o Atari Co-Sponsored Computer Shows.
If a user group wishes to put together an Atari show with Atari being a co-sponsor, this would be a possibility. This does not mean that Atari has to co-sponsor ALL Atari shows, just some.

REALLY, if Atari gets the user groups going (or what is left of them),
Atari can use them to help increase sales of the Falcon030.

>>Besides, it isn't healthy to use a computer all day long... especially
>>on online services!
>
>Hehehe. I do tech support, so all day long I stare at a Mac and a PC.
>Guess what I do to relax when I get home? Use my TT. :-)

I stare at the computer longer than four hours and I get eye sores and
headaches like you wouldn't believe.

Re: Jaguar vs. 3DO

Why will the Jaguar be more successful than the Lynx? All one must
do is figure out why the Lynx "failed".....

it failed for two primary reasons - 1.) High price 2.) A dearth of software.

Both have seemingly be corected with the Jaguar - if you believe what
I have said....of course, Mr. Baggett would like you to believe I was
a "liar"...he can believe what he wants of course, but it must be
noted that he has no great love for Atari, which could then be
interpreted as meaning he never 3wants Atari to succeed.......

Anyway, _if_ you choose to believe me, then the jaguar will see for
about $200, and have at _least_ 24 games available upon release.
Faced with a competeing machine priced twice as much (3DO) the choice
becomes obvious...

- Chris Millar

==========

Here is the latest information on the upcomming B.R.A.F., for those who
don't normally access to Genie, etc. Although not the largest, it has
been one of the most exciting and enthusiastic shows in previous years.
This year should prove even more fun, with Bel Chere festivities all around
downtown!
- dave.

==========

BLUE RIDGE ATARIFEST '93
Press Release - June 17, 1993

FOR IMMEDIATE DISTRIBUTION

The Blue Ridge Atari Computer Enthusiasts (BRACE) and Computer STudio
invite you to participate in the fourth annual Blue Ridge AtariFest
on Saturday, July 24 and Sunday July 25, 1993. The show will take
place in the Courtyard Shop area of Westgate Shopping Center in
Asheville, North Carolina (Home of Computer STudio).

We are still signing up additional exhibitors, but those who have
already made a firm committment to attend include (Alphabetical
Listing):

Atari Corp/Applied Audio Marketing . Atari's Southeast Regional
Representatives will be on hand
to let you know what's going on
in the Atari world, especially
here in the Southest U.S.

Accusoft-ST ..... PD/Shareware Software (Desktop
Publishing Clip Art Libraries)

Barefoot Software ..... Professional MIDI Software
applications (SMPTETrack,
EditTrack Platinum, GenEdit, EZ
Score Plus, etc.)

Binary Ink ..... David St Martin will discuss his
own desktop publishing business
and conduct informative seminars
on "Marketing Your DTP Skills"
and "Newsletter Desktop
Publishing".

Codehead Technologies ..... Productivity software &
enhancements (G+Plus, MultiDesk
Deluxe, HotWire, CodeHead
Utilities, Warp 9, Calligrapher,
MaxiFile, Lookit & Popit, Avant
Vector, MegaPaint, TOS Extension
Card, etc.)

Computer STudio ..... Visit a 'real' Atari Dealership
in the mall (Atari computer
systems, software and
accessories)

DMC Publishing ..... Desktop Publishing System
Solultions (Calamus/SL, PKS
Write, Outline Art, Invision
Elite, tms Cranach Studio, etc.)

GEnieLamp/GEnie ..... Telecommunications and
Electronic Publishing

JV Enterprises ..... Developers of low-cost
license-ware software and games.

Lexicor Software ..... Professional animation and
rendering software (Prism Paint,
Phoenix Render, Meridian, etc.)

MagicSoft ..... Entertainment Software (New
products unveiling!)

Missionware Software ..... (Flash II, lottODDS, Printer
Initializer, etc.)

Showtimes are 10am - 6pm on Saturday, and noon-5pm on Sunday.
Seminar sessions will be scheduled throughout the show.

Since this year's show coincides with Asheville's annual Bele Chere
Street Festival, we are not having a Saturday evening banquet, but
are instead encouraging guests to hop the shuttle bus at the front
entrance of the mall and spend Saturday evening downtown enjoying
the outdoor festivities (live entertainment, food booths of all
types, dancing, etc.).

Advance registration is only $3; or $4 at the door. Additional
information about the show and Asheville's Bele Chere festival will
be mailed to all who pre-register in advance. Door prize winners
will also be selected from registered guests (you need not be
present at the time of the drawing to win). Advance registration
checks should made out to "COMPUTER STUDIO" and mailed to:

Computer STudio
Westgate Shopping Center
40 Westgate Parkway - Suite D
Asheville, NC 28806

> expected.

Close. I believe speculation says that the Panther was near release, when someone noticed the Jaguar project was proceeding much faster than expected. A re-assessment of the Panther's abilities put it about equal with the market at the time (most notably the Sega Genesis, I think). Given Atari's financial-strapped position, they decided to not use the money pushing a weaker project and went gung-ho with the Jag.

Look, Len, I'm not going to go tit for tat with you. Atari doesn't have the resources to do what you want them to do. Atari doesn't need a department to handle user groups. They need to sell computers.

> o Build a closer relationship with Atari user groups.
> Most user groups receive no support from Atari making it nearly
> impossible to continue existence. A relationship is needed to increase
> user group members spirit and give the feeling that Atari cares.

Do those user groups ask for support? We've asked for things from Atari, such as Falcon brochures and have gotten them. We've even asked Bob Brodie to come and show the Falcon, which he's done, on a Saturday even. He done the same for other groups in our area.

> o Establish an Atari User Group Information Network.
> A Bulletin Board System (BBS) STRICTLY for the exchange of user group
> articles, files, and information.

Yeah, who's gonna run it? Better yet, who's gonna call it? I'm the only officer in my user group who gets on-line with any regularity, and the rest of them sure aren't gonna call long distance to a user group BBS. Frankly, I think it would be pretty boring.

If you want user group excitement, get a GEnie account. They have a whole category devoted to it and it gets plenty of traffic. Would you believe they even have a Roundtable that surrounds it, full of useful information about your ST, instead of the bullsh*t you read in this newsgroup from people who have personal grudges against Atari.

All these ideas you have are fine and dandy. But the fact is that Atari doesn't have the manpower or the money at this time to implement something like this. Their resources are much better used in other areas. If you want to see Atari survive like I think you do, they'd be better off trying to manufacture and sell computers than they would spending their time forming user group alliances.

>>Hehehe. I do tech support, so all day long I stare at a Mac and a PC.
>>Guess what I do to relax when I get home? Use my TT. :-)
>

>headaches like you wouldn't believe.

Then don't stare at the computer. Look away every few minutes. Let your
eyes focus on something else, even for as little as 10 seconds.

If Atari can prove that someone's violated an NDA, Atari can win a suit
against that person. Just trying to get information out of someone who
has an NDA, however, is perfectly legal. (Ethics, again, aside.)

For Atari, the Lynx has been quite successful, and still continues to sell well. No, it doesn't have the market share of the Gameboy or the Game Gear, but it makes money for Atari, and that's what counts.

If you want to address the fact that the Lynx has "failed" to gain as much market share as the others, the reasons you list are not the real reasons.

> it failed for two primary reasons - 1.) High price 2.) A dearth of software.

The Lynx doesn't have the visibility or the availability of the other machines. This is the same thing that plagued the ST.

Atari prefers to be conservative when manufacturing computers. They want to make sure they can sell what they make. You wouldn't make more food than you can eat. Well, Atari doesn't want to keep any "left-overs" either. Sure, you can store your left-overs in your refrigerator until it rots, and then throw it away. Computers don't rot, but they do get obsolete very fast (almost as fast as food rots), and you need a lot more room to store tens of thousands of computers than you need to store a week's worth of left-overs.

We won't even go into the costs involved in making the computers and then storing them because they can't be sold. Can you say, "Throw away money?" I knew you could, and we're not just talking about a coupla days' worth of groceries either.

> ^^^
>Competitive with 3DO.
>

First of all, let me state that I think all comparisons of the Jaguar
and 3DO are silly. The 3DO is really much more than a game machine in
some ways, it really seems closer to a laserdisc player than anything
else. The Jaguar is really just a game machine (though theoretically
a really really cool one)

That said, let me add fuel to the comparison war. :-)

How much RAM does the 3DO have? I have an article here in front of me
from Electronic Engineering Times (not some mindless game mag or
newspaper article) that has a nice diagram of how the 3DO is
organized; the RISC is connected to the DMA is connected to the VRAM,
etc. Anyway, the first unplesant bit of information arrives - it
seems that under VRAM, we have 1 Mbyte. Ok, that's pretty good so
far. But then, on to DRAM. It seems we have another 1Mbyte, with
more being labled a "future optinal extension". So where is the 3DO
going to plastering 400x400x24 Joe Montana images? Since most games
as you point out will probably be on CD, that 1 Mbyte limit is fairly
unpleasant!

>>Jaguar, in the flesh (or silicon I suppose), and probably a "minimal run"

>

I have heard that the Jag will have a CD (though not with the base
model at $200!) Although that info like almost anything else said
about the Jaguar has little base in fact right now.

For further fun, some other "optional extensions" for the 3DO are the
video input (so you can texture map yourself on a bouncing ball or
whatever) and the video decompression cartrige.

P.S. - I also consider it a Bad Thing that each 3DO developer gets a
CD of film footage that he can use in his games - it would be much
more direct for 3DO to strap the new 3DO purchaser into a chair and
make him watch the footage 1,000,000 times - after all, he will anyway
when the same footage is in game after game after game.... Much more
impressive would be some kind of announcment that all 3DO developers
have some way to easily obtain permission for movie footage through
the parent companies.

>>I just have a soft spot for Atari, and didn't want to see

There is another way of going about it....

I've seen adverts for systems which are 386/486 IBMpc systems with
Sega hardware built into the same box. Flip a switch and your
VGA PC is now ready to run Super Mario Brothers.

Considering the size reduction of equipment over the last 10 years
it's trivial to have 2 completely different sets of hardware in the
same box, or even on the same motherboard.

How about it - A PC desktop sized case with Falcon and Jaguar
inside. Possibly 2600, etc compatibility too as has been suggested.

It'd be better than a multicart games machine, as you don't need to
shift it to do serious computing. (While we're at it, why not add
a 486,etc and have PC compatibility too? Emulation is nice, but
hardware switching is much faster.)

>

But, Ed, this is part of selling computers. How do you get support when
you need help with Atari computers? You log into GEnie, Delphi, or use
Usenet to get your information.

How do other people that don't have access to Usenet or can't afford
to use GEnie or Delphi get support?

There are very few dealers out there and some dealers do not really have
enough time to spend with their customers as needed.

Why not call Atari up? They call Atari up and they get even less support.
They get a person on the phone that doesn't know what products Atari has--
how are they going to tell you how to use them?

Atari User Groups _ARE_ a way to sell computers and give people something
that they cannot get on another platform--support.

And YES, they _CAN_ afford it. Most of what I stated will not cost Atari
a lot of money. And I propose an Atari gift catalog where the company can
sell t-shirts, sweatshirts, coffee mugs, etc. to pay for everything that
I have mentioned.

If you sit down and think about this (something that many people don't do),
then you will realize that Atari has not filed for bankruptcy because
of LOYAL Atari users. So, how do you insure that the company doesn't go
under? Create more LOYAL Atari users.

Where are you located Ed? Did Bob Brodie fly half way across the
United States to visit your user group? Or did he jump in a car and drive
to your user group meeting?

As for Atari user groups (ASKING) -- I once put together a small show
which was inside of a festival which attracted 12,000 people. I requested
brochures, banners, or anything else that would help us get the word out
about Atari products. What I get? I didn't even get a reply.

Most user groups have dwindled away because Atari has not shown an interest
in them. Atari has to call up the President of the user group if they
need any help, etc.

>> o Establish an Atari User Group Information Network.

"Frankly, I think it would be pretty boring." give me a break!

If there was information on it concerning user groups and could help your
user groups, your user group would call it.

As for YOU being the only one that gets online regularly-- THANKS you made
my point in the above statements. Many people don't get online systems
and they are the people left without support. I'm sure if you weren't
so active online, your user group would be pretty much clueless.

As for WHO would run it. This would be the job of a user group coordinator
at Atari.

(Who did you think--Bill Clinton?)

>time forming user group alliances.
>

They ought to do both. I believe without a doubt in my mind that user groups
can be a very important part in selling Atari computers.

If anyone belongs to an Atari user group still, they must be pretty darn
devoted. And they have definitely helped Atari.

As for MONEY, like I suggested before, an Atari Gift Catalog would be able
to support this user group push. I _know_ Sierra makes a reasonable
amount of money selling shirts, bags, etc. I _know_ with all the Atari
fanatics out there, Atari could make a good amount of money on these things.

>

1058. Availability of STReport, Z*Net, and Atari Explorer Online

Newsgroup: comp.sys.atari.st
Date: 1993-06-26 15:20:55 UTC
From: aa399@cleveland.Freenet.Edu
Message-ID: <20hpgn$k8l@usenet.INS.CWRU.Edu>
Source record: 204084
Cross-posted to: comp.sys.atari.st,alt.games.lynx

A number of people have written me about how they can obtain Z*Net and other online magazines.

The Cleveland Free-Net usually gets the issues a couple of days after they are released (except with Z*Net which they have been getting several days after release).

Anyhow, this is how you can access the Cleveland Free-Net:

The Atari SIG is a Special Interest Group servicing all Atari computer users and Lynx video game players. The SIG Operators that help run the Atari SIG are volunteers that have an interest in Atari computers and Atari products. The opinions of each SIGOp do not necessarily reflect the Atari SIG nor that of the Cleveland Free-Net. The Atari SIG is run by individuals and is no way affiliated with Atari Corporation. The "Atari" name, logo, and any other Atari products mentioned here are copyrighted by Atari Corporation. The Atari SIG is made possible by the NPTN, CWRU, INS, and you, the user who contributes time and information.
The Central Atari Information Network (C.A.I.N.) is the official user group of the Cleveland Free-Net Atari SIG. The meetings are usually electronic and are held in the Multi-User Chat area on Free-Net.
A live gathering of C.A.I.N. members is held once a year. The C.A.I.N. official newsletter is published in electronic form once a month. The Cleveland Free-Net can be accessed by the phone number: "216/368-3888" at either 300, 1200, or 2400 baud. It can also be accessed by users around the world for free by using "telnet" at their college or business by the following Internet addresses: 129.22.8.38, freenet-in-a.cwru.edu, freenet-in-b.cwru.edu, freenet-in-c.cwru.edu, or hela.INS.CWRU.Edu. There is no charge for the use of the Atari SIG or the Cleveland Free-Net.
The information within this SIG is believed to be reliable but cannot be guaranteed.

I copied this from the "About the Atari SIG" text-file located on Free-Net.

I hope it helps!

Len Stys

P.S. It has about two and a half years of back issues.

In article <C97oy3.7G7@sugar.NeoSoft.COM> kendall@NeoSoft.com (Kendall Gelner) writes:
>How much RAM does the 3DO have?

I don't remember; it may be 1M or it may be 4M. I'll check on that.

>So where is the 3DO going to plastering 400x400x24 Joe Montana
>images? Since most games as you point out will probably be on CD, that
>1 Mbyte limit is fairly unpleasant!

Yeah, I agree that that is a rather serious issue. They can keep
things JPEG'ed or MPEG'ed in RAM and decompress them in real time, but
it's still not very much. I have seen the 3DO play QuickTime movies
from the CD in real-time, however. The CD's capable of at least 300K
per second so you can push enough data through for that. Still, game
designers will have to be a bit clever (as they are now for cart games)
with what they keep in RAM. The cart machines only have 64K of RAM,
so you can only be using 64K of changeable stuff at once, even though
you can have 2M of unchangeable stuff.

>P.S. - I also consider it a Bad Thing that each 3DO developer gets a
>CD of film footage that he can use in his games - it would be much
>more direct for 3DO to strap the new 3DO purchaser into a chair and
>make him watch the footage 1,000,000 times - after all, he will anyway
>when the same footage is in game after game after game....

This is a huge amount of data -- *170* CD's. Plus you get new ones
every quarter or so. With that amount of material it seems unlikely
that all the games will use the same set of images. I doubt any single
game designer would even *see* all the stuff.

>Much more impressive would be some kind of announcment that all 3DO
>developers have some way to easily obtain permission for movie footage
>through he parent companies.

That option already exists, even for Nintendo and SEGA game designers.
Those kinds of negotiations have to be made on a case-by-case basis.
Compiling a license-free library just saves people time and hassle.
But if you want to use footage from Jurassic Park, it's not going to
come easy!

>Hey, the bottom line on your .sig takes up > 150 chars...

Actually, the top text line. I do that because it can only be four
lines total and I want it to look like 5. It works on screens that
wrap.

Source record: 204087

I am using Verasoft's dbMAN V (ver 5.03) and it works fine until
I use a index. Once I do this display, browse, edit by record number,
you name it doesn't work. Even letting the applications generator
create a do file comes up with errors. The two most common errors are

Err 79 - The variable is undefinded
Error 79 line 8 program DISP Refer to Appendix A

and

Error 54 Syntax Error

What's going on, even their Applications generator doesn't work.
~~~~~~~~~~~~~~~~~~~~~
Also, does anyone have the # for their BBS, my number just rings.

Thanks in advance,

>In a previous article, ekrimen@netcom.com (Ed Krimen) says:
>>In article <20fvgh$40n@usenet.INS.CWRU.Edu> aa399@cleveland.Freenet.Edu (Len Stys) writes:
>>> Atari could take action to revitalize Atari user groups by doing the
>>> following:
>>>
>>> o Atari User Group Services.
>>> Organize a department at Atari Corporation to specifically deal with
>>> user groups.
>>
>>Look, Len, I'm not going to go tit for tat with you. Atari doesn't have
>>the resources to do what you want them to do. Atari doesn't need a
>>department to handle user groups. They need to sell computers.

Agree with the former, but not the latter. Atari -- simply put -- doesn't have the resources to do the wishful thinking that Len espouses. If they had the resources, however, good relations with the user community cannot hurt. But this is a LUXURY, not a necessity (manufacturing is a necessity, by comparison).

>There are very few dealers out there and some dealers do not really have
>enough time to spend with their customers as needed.

Those are pretty pitiful dealers, then.

>Atari User Groups _ARE_ a way to sell computers and give people something
>that they cannot get on another platform--support.

User groups are a good idea, but they have existed for long periods of time without any official company support.

>And YES, they _CAN_ afford it. Most of what I stated will not cost Atari
>a lot of money. And I propose an Atari gift catalog where the company can
>sell t-shirts, sweatshirts, coffee mugs, etc. to pay for everything that
>I have mentioned.

Len, you're fantasizing. I mean, you might be able to get me to buy a mug and a T-shirt, but that's not a whole lot. Multiply that by the number of people who would be willing to buy such trinkets, then subtract the cost of printing up the catalogue, manufacturing the gifts, and distributing the same. Such a "gift catalogue" idea could end up COSTING Atari more money. Even if you throw in Lynx owners and Falcon users and Jaguar enthusiasts, you're still talking about a lot of slick paper selling to a very small audience.

>>> A Bulletin Board System (BBS) STRICTLY for the exchange of user group
>>> articles, files, and information.
>>
>>Yeah, who's gonna run it? Better yet, who's gonna call it? I'm the only
>>officer in my user group who gets on-line with any regularity, and the
>>rest of them sure aren't gonna call long distance to a user group BBS.
>
>If there was information on it concerning user groups and could help your
>user groups, your user group would call it.

Setting it up would be fairly trivial; running it would not. As a former co-sysop of a BBS, I can say that even a trivial BBS would take a good chunk of time to run. And Ed is right; it's _not_ going to get a lot of caller traffic. Think of how often you actually NEEDED information on running a user group, Len. It's not a lot.

>Also, I like to see both sides. I realize that not everything is as rosey
>as you like to believe with Atari.

Len, I mean this in the nicest way possible, but sometimes you're so optimistic about the future of Atari that even *I* wonder if you're on the payroll. B-) On the other hand, you also get into mood swings, and try to drum up massive letter-writing campaigns. "The fate of the company rests in our hands!"...Right, Len.

(My most favorite recent Len-ism: "Atari hasn't announced it, but a VR interface for the Jaguar is in the works! I'm sure it is!")

>>All these ideas you have are fine and dandy. But the fact is that Atari
>>doesn't have the manpower or the money at this time to implement something
>>like this.
>
>They ought to do both.

Ed is right again. As much as Atari users would like otherwise, the company is SMALL, with limited resources. Yes, "they ought to do both", and if they had as much capital as Apple or IBM, I'd be infuritated if they didn't. But that's in a different reality from the current one we live in.

>As for MONEY, like I suggested before, an Atari Gift Catalog would be able
>to support this user group push. I _know_ Sierra makes a reasonable
>amount of money selling shirts, bags, etc. I _know_ with all the Atari
>fanatics out there, Atari could make a good amount of money on these things.

Pure speculation. I wouldn't be surprised if a Gift Catalogue becomes a source of red ink. And if it isn't, the items it advertises will be priced so high that most folks will not bother to buy from it ("$25 for a T-shirt? Forget it...").

If you want to really help Atari, do the following:

1. Win the lottery. $10 million is nice, $30 million is better.
2. Give it all to Atari Corp.
3. Supervise the use of your money (on your own time) to make sure it is not

fritted away on executive perks.

It takes money to make money. The only reason the Lynx didn't sell as well as it should is because of insufficient funds to push a decent ad campaign and distribution network. If anything is going to kill off the Jaguar, the most likely culprit is this same demon...

1064. PCBoard Designer copy protection

Newsgroup: comp.sys.atari.st
Date: 1993-06-26 20:13:36 UTC
From: esj@harvee.billerica.ma.us
Message-ID: <H.eg.2&9AcSPwE&o@harvee.billerica.ma.us>
Source record: 204090

I am looking for either a way to break copy protection on Abacus's PCBoard designer or a non-copy protected PC Board CAD program. Before you flame me, be aware that I own a legal copy with all the serial numbers (520231) and read my tale below...

I bought a copy of PCBoard Designer a couple of years ago and tried to use it without any success. everything sort of worked but I couldn't do anything useful with it. So I stuffed it on the shelf as useless.

recently, I needed to design a PC Board and I thought I'd give it another try and I went through the tutorial again. I had the same results happen: couldn't save files, editing component lists and connection lists worked only for the first page, I couldn't print layouts.

scratching my head, I thought, "could this be caused by copy protection?". so I dug out the backup disks from Abacus and ran PCBoard designer again and it worked!

Learning a cad program takes a non-trival amount of time and energy. I am not thrilled at the thought of spending hours on a program only to have it rendered useless by my flakey a: drive acting up. I want to break copy protection to protect my data and labor. If such a thing is not possible, I'll sell my disks and manual to the first 75$ that comes my way and head off to the DOS world for PCB CAD use.

My definition of breaking copy protection include (but are not limited to) copying the key disks in such a way that they work as keys or hacking on binaries.

Counting on Abacus to keep me supplied with disks is *NOT* a valid answer.

Thanks in advance for constructive suggestions.

I've been spending quite a bit of time testing the hardware flow control on my Mega ST4 with TOS 1.4. I've been using Flash II primarily but at 19.2 I've tested ConNect 1.96 and Uniterm. I've found that on my system none of these system provide hardware flow control at 19.2Kbaud. On Flash II I tested various other speeds and discovered that flow control starts working at 4800 Baud and down! I presume that this is a problem with the Atari MegaST serial port and that all other products would have similar characteristics.

Yep, I've already played it and must say that it's a really good game. The
first time in months I played a ST game for longer than half an hour, I
even played it for 2 hours before I got bored with it.

But it has a long lasting appeal. It makes you coming back for more and
more, the levels are hard (especially in World 2) but there are not as much
puzzles to solve as I'd liked, then again, I've only reached level 3, World
2 :-)

Well I think what programmers should really focus on is being able to view .GIF pictures they way they were meant to be seen.. When you convert it to any ATARI format, you loose ALOT, both resolution and color... If we could view these .GIF pictures the way they were created, or as seen on an IBM screen we would be much happier. In the past this has not bee possible because of the low resolution and limited colors of the ATARI ST. Even with graphics cards, it was never done because of the problems with writing software for these. Until now. Lexicor has released the 24 bit graphics cards, 16.7 million colors at high resolutions that come with VDI drivers, and will work from a regular 1040 STe to the Falcon computer. This is the perfect piece of hardware, and once enough programmers get to work with it, we will be able to see what we were missing.

Thanks

>games as well. If not, I doubt that developers will really embrace it
>in the face of the buck-a-disk reproduction costs for 3DO CD's. This
>is one problem they need to fix soon if they want to compete with 3DO
>and SEGA (both of whom have CD-based systems now).

ok, I disagree.
1. So far, the "CD gaming" which has been around the corner since 89. I
have yet to see any game on CD worth the media. While 7th Guest is neat
to look at, and all, but the puzzles were simple and the game was
general less interesting than an old Scott Adams adventure. On the
Sega, Cobra Command is a rather strange game but no more frilling that
Thunder blades, infact less so.
2. CD-I, Sega CD, Turbo Duo, and CD-roms, while have sold ok, haven't
been a big sucess. Unless a game comes out to convice people that they
HAVE to have a CD using unit, they may not rush to shell out the extra
money. ($200 compared to $700 is a BIG difference)
3. A Cartridge is a part of the hardware. If you want to expande the
abilities of the machine for your game, you can incluse extra chips.
Your stuck with CD's

>(You can mail order any software or third party hardware.)
>
> But remember, this is in all our best interests!
> See Ya!

Some where in the back of my head, I dreamed of a meeting that went like
this:
"Ok, Atari has this great new computer." says person one.
"So, how are you going to sell it?", ask person two
"In stores, ofcource!", replies person one
"In stores like Circuit city, and Sears?", ask person two
"Hell no. Only atari dealers in remot corners of the world." said person one
"So what if a consumer doesn't have a store near by?", ask person two
"Hmm.. let me thing.. wait I got it! Their OUT OF LUCK! We can't make it
simple. What if we sell to MANY? We might *gasp* have software produced
for these computers!! We CAN'T have that!", yells person one.

I hope they don't do this with the Jag. You might as well bury the
company now.

ZOO Problems..

A chap on GEnie hase programed a Archive converter, seems to think
that ZOO can't compress Directories or a Directory..??

If so what is the format..?

Is this the case, so can it do a R or a R2 as in LZH201 and
can you set the base directory as in LZH201, like \test\ *.*

This program looks very good CWACS3_01.LZH..

It can convert a batch of mixed archives to one, there is also a BBS version if
you Register it..

Some one might like to post it to A.A...??

Thanks.............

Roger............. sheppard_r@kosmos.wcc.govt.nz

1077. Hermes and file transfer problems.

Newsgroup: comp.sys.atari.st

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hi there,

I've already left a posting on this subject about a week ago, but got no replies.

I've been having some problems with Hermes 1.04 not getting a file tranfered from my host node using the "uucp" command. When polling the host, uucico goes into slave mode receives a small amount of data (I know this only by watching the modem lights) then everything stops with no data transfer in either direction. After about 5 seconds uucico times out with a waiting for data block message.
I've tried a number of different strategies to get more info, including getting hold of the latest version of uucico (3.71) and also trying different size packets etc. While trying different packet sizes I got a further error message about a validation problem with some data. This is about the only clues I can offer. All signs would tend to point to trouble from my host site end, but the sysop there assures me everything is setup as it should be and that his site feed quite a number of different nodes quite happily without having had any trouble like this.
Any help or suggestions would be gratefully received. I've set everything I think should be set up like a UUCPPUBLIC directory. Is there somewhere where I should tell the system to accept files from my host (some sort of write permission system???)

Please help me on this one as I've been struggling for well over a month on this one.

Cheers,

1079. Re: Factual Information on the Atari Jaguar, Direct From Atari.

Newsgroup: comp.sys.atari.st
Date: 1993-06-27 09:46:34 UTC
From: Bob_BobR_Retelle@cup.portal.com
Message-ID: <84169@cup.portal.com>
Source record: 204100

Rob Nicholson from Handmade Software participates regularly in the Lynx and Jaguar message areas of the Atari forums on CompuServe (Handmade is responsible for several Lynx games), and has said that they're a Jaguar developer, with the Jaguar development unit, but like everyone else, he's under a nondisclosure agreement, so he can't say anything about it.

Atari (Juli Wade, John Scruch and Bob Brodie) have said that there's a technical spec listing that's being worked on which will be released "RSN" which should help answer a lot of the questions that have been asked about the capabilities of the Jaguar.

They may also release a list of the third-party developers who are working on games for the Jaguar.

GIFs don't need 24 bit colour - they only need 8 bits (256 colours
max.) - and a Falcon/SVGA monitor combo can show them pretty much
perfectly. BTW if this board sticks to the rules then 'good' programs
like Gemview and ImageCopy will be able to show GIFs on it anyway
since they use VDI calls exclusively for their picture display. (And
also use VDI calls to see how many colours/screen planes are available
to them)

Has anyone bothered to call Motorola about this yet? We're not likely
to get any real info out of anyone at Atari; they're probably still
convinced that the Falcon is on schedule and due to start shipping
zillions of units any second now.

DiamondBack II is great; compresses pretty well, and deal with high
density floppies (the only one I know of that will; backups go much
nicer on 1.66M floppies!).

DiamondBack II is available from Oregon Technologies for about $70 (I
think)... Well worth the $$$!

1086. Complete system $400

Newsgroup: comp.sys.atari.st
Date: 1993-06-27 17:24:41 UTC
From: mg20+@andrew.cmu.edu
Message-ID: <cg=RTNy00iUxM1g44o@andrew.cmu.edu>
Source record: 203959
Cross-posted to: misc.forsale.computers,misc.forsale.computers.other,comp.sys.atari.st

From: Michael Paul Greelish <mg20+@andrew.cmu.edu>
Subject: Computer for sale: $400
Date: Thu, 24 Jun 1993 13:48:50 -0400

For sale, $400 with printer, $350 without:

Atari 1040ST computer, with 13" color monitor, printer, mouse,
joysticks, and tons of software.
Very similar to an Amiga 1000. $470 cheaper than a Classic II at the
computer store, and it comes with a printer, COLOR monitor, and loads of
software. Beat that.

Specs:

Motorola MC68000 processor @ 8MHz. Fast as a Mac Classic or SE, or a '286 PC.
Available adapter (Spectre GCR) to run Mac black and white software.

1 Meg RAM, 192K ROM.

1 720K 3.5" floppy drive, IBM-compatible (you can read and write IBM
disks, which means that with the Apple File Exchange, DOS Mounter Disk,
or SoftPC, you can export data [i.e. word processing documents] to a
Mac. Hell, you can even export data to a REAL IBM-compatible with a 3.5"
drive.)

13" hires Atari color monitor. 640x400x16 colors, or 320x200x256 colors.
Sound included.

Printer specs:

Epson LX-90 dot-matrix with tractor feed. 160 cps draft, 60 cps letter
quality. Boldface, italics, underline, graphics, foreign fonts, the
works. Comes with 1000 sheets tractor-feed paper.

Serious Software:

Word Writer 2.0. PC-compatible word processor. 85,000 word spell
checker, thesaurus, outliner, mail merge, etc.
DEGAS Elite. Way cool paint program.
Lots of utilities (disk fixers, file managers, anti-viral stuff, etc.)

Games:

Falcon 1.3 with add on disk-- Operation: Firefight. Just like the PC
Falcon. Full color 3-D.
Their Finest Hour-- Awesome Lucasfilm WWII air combat simulator. Just
like PC version.

Populous-- Just plain fun.
Breach 2-- A futuristic wargame where you control a squad of Space Marines. Much like "Aliens", only YOU control the Marines. Some serious enemy AI here. Comes with add-on mission disk.
Prime Time-- Hilarious parody of running a TV network.
Carrier Command-- A huge (1 Meg, compressed to an 800K disk) wargame. Command an aircraft carrier battle group against another carrier group. Can take WEEKS to finish.

Other Software:

Lots of 3-D graphics stuff. 2 years' back issues of STart, an Atari ST disk magazine.

Oh yeah:

2 joysticks, mouse, mouse pad, ALL documentation and cabling. Keyboard is built-in.

Reply via email to mg20@andrew.cmu.edu or phone me at (412) 422-2942. Leave a message if I'm not in.

1091. Atari Software Near Hamilton, Ont.

Newsgroup: comp.sys.atari.st
Date: 1993-06-27 22:07:34 UTC
From: roy@zooks.eng.mcmaster.ca
Message-ID: <1993Jun27.220734.28335@mcshub.dcss.mcmaster.ca>
Source record: 203962

Dear Atari Fans,

I have run into the difficulty that I don't know where local dealers
are. I live in Hamilton, Ontario. By local, I will settle for
anywhere within a couple hours drive, since I will likely pass by
anywhere that close sooner or later anyway. Any recommendations?
Where can I find software? Thanks,

Roy

1094. Re: The Glendale Show, Version 7.0

Newsgroup: comp.sys.atari.st
Date: 1993-06-27 23:32:37 UTC
From: afonseca@terapin.com
Message-ID: <afonseca.4ay3@terapin.com>
Source record: 203968

I've never been to the Glendale show, but for those of you who have, could you tell me about it? Is it BIG? I went to the San Jose computer show about 2 years ago or so, and it was really small, they had nice stuff but I was disapointed because of the size. I'd like to go to the Glendale Show, but I live in Oakland and its really pretty far ways to go, and I'd be really upset if it was small and boaring.

Thanks,

Alberto

I don't know if it's big enough to justify a trip to Oakland from. Imagine a show held by 5 or 6 local dealers and 3 user groups, sprinkled with two or three dozen developers. It's not something that draws 30,000 people, if you were wondering. But as a local who've always gone to the Atari Faires, it's worth it if you're not too far off. If I lived in Oakland, though, I would not go unless I had other things in Southern Cal as well, such as a visit with friends or family.

Glendale is about twice the size of that San Jose show.

I was at Glendale last year and it was pretty good. I might go this year
as well. The only thing holding me back is the trip, too; I'm in San
Francisco.

If I do go, I'll probably leave early Saturday morning and return Saturday
evening.

There was a show in Sacramento a couple of months ago. You should have
gone to that one. It was pretty good.

A friend wantsto write his next book on his Atari, but the publisher wants PC disks for the text. The problem is, the book will have a lot of footnotes.
Does anybody know an Atari WP which can write footnotes in a file compatible with the PC world? Redacteur writes for Wordperfect and Word, but drops the footnotes. Atari Wordperfect would be fine, if it is bug-free and still available (???)

There will be a new version uploaded at the same time I upload
MasterBrowse 2.6a to atari.archive.umich.edu. This will happen
on July 10, I expect. I have to wait for the archiver to return
from holidays before uploading it.

The new version of ESS UUEncode/UUDecode works with MultiTOS, and has
non-modal dialog boxes. The new version of MasterBrowse has non-modal
dialog boxes, works with MultiTOS, has support for TRUE archivers, and
is now 100% resolution independant (it will work fine on a TT). There
are also a bunch of other changes.

1107. Spectre and MIDI: a proposal

Newsgroup: comp.sys.atari.st
Date: 1993-06-28 09:37:05 UTC
From: mczane@deis58.cineca.it
Message-ID: <1993Jun28.103706.1303@cine88.cineca.it>
Source record: 203975

Mac applications under Spectre GCR/128 cannot, at least to my knowledge, exploit Atari Midi interface. In the manual Dave Small wrote that these programs directly access Mac-specific hardware which does not exist on Ataris.

I think this situation has changed considerably. There are at least three solutions for the Mac which offer high-level Midi system services and hide underlying Midi hardware. I am referring to MIDI Manager/Midi Driver from Apple, OMS (Opcode MIDI System) and the forthcoming FreeMIDI System from Mark of the Unicorn which is under beta test and will be available also in source form.

It would be then extremely valuable to have an instance of a driver of this kind providing full Midi capabilities for Mac applications under Spectre. If this has not been achieved yet (I would like to know about Fearn & Music in Stuttgart) I am calling for a group effort to develop such a driver.

Unfortunately, I have no programming experience on a Mac (or emulated Mac) and Dave Small does not seem too active at the moment. Thus I am willing to cooperate with interested/competent people to achieve this ambitious goal.
Email me at mczane@verdi.eng.unipr.it.

1108. Looking For Software

Newsgroup: comp.sys.atari.st
Date: 1993-06-28 10:24:11 UTC
From: jbryant@nyx.cs.du.edu
Message-ID: <1993Jun28.102411.10861@mnemosyne.cs.du.edu>
Source record: 203979

Hello! This newsgroup looks general enough that I can post this here. I'm looking for a software emulator that will make my 486/ms-dos machine think it is an atari 520ST. My primary reason for wanting to do this, is that I want to play a game I haven't seen in a long time. The game that I'm looking for is called Spelunker.

If someone out there has this game...even if you can't provide the emulator, or info about one, please let me know!! An ATARI 520ST was my third computer...and I've had an attack of nostalgia lately. I would love to play that particular game again.

Any help, or info would be greatly appreciated!! Please send any replies to <jcbryant@delphi.com, or jbryant@nyx.cs.du.edu>

Thanks you...

From: csullogg@cc4.crl.aecl.ca
Message-ID: <28JUN93.08381326@cc4.crl.aecl.ca>
Source record: 203984

You need to put SIMMs in pairs in the STE (the 1meg SIMMs for the STE are 8 bits wide so you need to pair them to get 16 bit memory). Some of my clients tried 2x1 megs and 2x256K but there were memory problems (even the freeware patch did not work). I suggest you chuck the 256K that came with the STE and put in 4 of the 1 megs (that will cost you about $180 CDN or about $140 US).

I know that on old versions of TOS, there was a bug that, when you tried to
write more data onto a harddisk partition than there was room for, the
following harddisk partition was corrupted.
Otherwise, it might be the way the harddisk is connected. If it is a long
cable (and more than 5 cm is concidered long), you should use harddisk driver
software that has verify. I had a similar problem myself, and it was solved as
soon as I enabled verify. Now, however, I have another problem with my power
supply, including a burned out resistor, so that the harddisk turns itself off
within seconds.
So... try to enable verify and see what happens. ;-)

1118. RGB Monitor,50pounds

Newsgroup: comp.sys.atari.st
Date: 1993-06-28 13:51:32 UTC
From: kiddlejc@vax.sbu.ac.uk
Message-ID: <1993Jun28.135132.2764@vax.sbu.ac.uk>
Source record: 203989

For sale, Microvitec CUB COLOUR MONITOR.

I can supply the relevant cable to attach it to any Atari,
Commodore, PC etc etc. Will connect to most computers. RGB
analogue or TTL. Good picture, I use one myself and
I've got one spare.

If you want to use it with CUBASE or similar high resolution
software, I can supply a Public Domain mono emulator accessory
that gives you a very useable picture on a colour monitor.

If you play a lot of games, a monitor like this could
definately help improve the health of your poor eyes...

Delivery within a reasonable radius of Peckham or Ladbroke Grove
can be arranged free of charge.

50 pounds, including cable and
delivery, or nearest offer.

Now you can't say fairer than that, can you.

Leave a message on 081-693-2846 and Ill get back to you
as soon as possible.....

> Also, is there any way to edit the icons and make new ones.

There recently was some discussion concerning this tpic on the Atari Benelux BBS. The German company Shift has made a program called ZOOM that does icon editing/creating. The also make Interface the RSC editor. I don't know of any US distributors. Neither do I ave one of these programs but from what I hear they do a good job.

1123. Mint with UNIX filesystem (Minix Filesystem) on 1040ST

Newsgroup: comp.sys.atari.st
Date: 1993-06-28 15:42:40 UTC
From: bmeier@rzu.unizh.ch
Message-ID: <1993Jun28.154240.267@rzu-news.unizh.ch>
Source record: 203992

Hello all

Where can I get the Minix filesystem ?
Who has installed the Minix filesystem on an 1040ST ?
What have you to do?
Is it the only Unix filesystem for the Atari ?
What are the advantages of such a filesystem against the atari FS ?
Does such a filesystem also work with Jeff Jackson's port of the GNU
file, misc, shell and text utils?
Please answer by mail to bmeier@rzu.unizh.ch.

By the way, are there other possibilities for a UNIX like environment
then the GNU ports ?

Thanks a lot

Beat

Source record: 204000

Just wanted to post a public 'thank you` to Bruce Welsh and all those of the Kansas City Area Atari Groups for hosting the KC AtariFest this past weekend.

Although attendance was disappointingly light (as in _very_), I believe all the participating developers and vendors still had a good time (I know that I did) even though many lost money after travel expenses.

It's a shame the show was so sparsely attended but it was certainly not the fault of the show promoter(s) who did an admirable job, IMHO, of getting the word out to the public. Atari shows such as this are perhaps the best 'finger on the pulse' of the Atari marketplace and Atari Corp would do well to pay close attention to how well these shows fare.

Thanks to those who attended and for the great steak at the Golden Ox! :)

>know what I can do about it? Thank you!

There are two possible solutions (well actually three, but let's hope you
don't have to go so far as to buy a new keyboard!):

Using a small flat tip screwdriver or other suitable tool, gently pry the
plastic caps off the offending keys. Clean the little plunger beneath the
caps with a blast of air and or a small shot of contact cleaner. Make sure
the little spring is not binding. Reinstall the plastic cap and try again.

If that doesn't work, you need to disassemble your keyboard so you can get to
the plastic keyboard membrane beneath the keys. Gently remove the little
plastic retainers that hold the membrane in place so you can turn it over to
reach the metallic contacts that ground out whenever a key is pressed. Take
a soft rubber pencil eraser and lightly clean the contacts so they are shiny.
Reassemble your keyboard and try it again. Betcha she works this time.

1128. IBM and Atari have teamed up on the Jaguar!

Newsgroup: comp.sys.atari.st
Date: 1993-06-28 17:34:03 UTC
From: lancer@wpi.WPI.EDU
Message-ID: <LANCER.93Jun28173403@wpi.WPI.EDU>
Source record: 204107

According to CNN, Atari Corp and IBM have teamed up to produce the Jaguar!

This makes some sense since IBM has NO products in the computer game field but does have the resources to make it a sucess, while Atari has the product but not the resources...

CNN says IBM will be building the Jaguar and that they'll be in stores in the Fall at around $200.

That's all I know... Anyone have more info?

>disapointed because of the size. I'd like to go to the Glendale Show, but I
>live in Oakland and its really pretty far ways to go, and I'd be really upset
>if it was small and boaring.

Along with WAACE (the show in D.C.), the Glendale Atari Show has typically been the largest Atari-specific show in the U.S. Keep in mind that the downward slide in the popularity of Atari computers most certainly has a negative effect on show participation/attendance, however. The 1992 Glendale show's attendance was considerably lower than years' past and of course, there are no guarantees about the 1993 version. And you cannot blame developers and vendors for choosing not to exhibit if they question their ability to recoup their travel, hotel and show booth expenses. But if you live in California and are really interested in things Atari, you would be doing yourself a huge disservice, IMHO, not to try to attend. It _may_ be smaller, but it will surely be larger than the less well known local shows and Atari Corp always supports the Glendale show well. John King Tarpinian always does a good job and I, for one, will sure try to be there. You should too. :)

From: smiller@bnr.ca
Message-ID: <1993Jun28.194248.7841@zoonews.bnr.ca>
Source record: 204106

I went to have a look at a Falcon030 the other day.

Overall, I wasn't impressed. It looked and felt like my 520ST, only faster. Which was nice, because I had to reboot it a lot, and it didn't take very long. The flicker-mode was MUCH worse than any Amiga I've ever seen. It was OK on a VGA, except that a bunch of the demos and things either wouldn't run or were messed up.

On the other hand, some of the demos showed A LOT of promise in the machine. And I didn't use it for very long, and it wasn't set up particularly well, and there wasn't an awful lot of real s/w to look at.

So, I'll have to check it out again in a few months. But still, I went predisposed to *like* this thing, (even if I gave up on buying one months ago) and I was kind of disappointed.

They were $1649 CDN, in the 4/80 configuration. (This is $400 or $500 less than a Centris 610 here, or about the same as an LCIII, for those interested in such comparisons)

Hello floks,

My roommate and me have 'plugged' our two computers together with a serial cable between our two serial ports. I have an 'ol 286 and he has an also old 520ST (soon to have 1mb of RAM).

So with a null modem and a serial cable, we linked our two computer together. Now we can transfer files from one to the other and 'chat' using our communication programs.

Now, what would be interesting: We would like to give the ST a 'direct' acces to the 286's HD. There are some PC to PC programs like PC-Link that can do that kind of stuff but is there something like it for an Atari-IBM duo?

Any infomation welcome or also any tips on how to program such a thing.

Chrisitna.

> Hello all

Hi!

>Where can I get the Minix filesystem ?

Look on atari.archive.umich.edu in the atari/Mint/Filesystems directory. There are several versions; I think 5.5 is the latest binary release, but there are more recent source-code-only beta releases for the brave in the same directory.

>Who has installed the Minix filesystem on an 1040ST ?

I have, and I know many others who have...

>What have you to do?

If you get a binary release, just follow the instructions...it's very simple, you put the minixfs.xfs file in the directory from which you boot mint, reboot, run minit.ttp to initialize one of your hard disk partitions as a minix filesystem, and you're in business.

>Is it the only Unix filesystem for the Atari ?

It's the only one I know of. Supposedly there's a filesystem in the works based on the UNIXMODE idea from the TOS-gcc library, to allow UNIX filenames on a TOS filesystem. But this rumor had been around almost as long as MiNT has, and I haven't seen it yet...

>What are the advantages of such a filesystem against the atari FS ?

Longer, mixed-case filenames, with as many dots in them as you please. Also a heck of a lot faster.

>Does such a filesystem also work with Jeff Jackson's port of the GNU
>file, misc, shell and text utils?

I don't know, I've ported many of my own, I use some of jrb's ports, and Eric Smith's port of the fileutils (with a few hacks of my own). If Jeff Jackson's port doesn't do nasty things like mashing up filenames into DOS format without your permission, it should work fine.

>Please answer by mail to bmeier@rzu.unizh.ch.
>
>By the way, are there other possibilities for a UNIX like environment

>then the GNU ports ?

Yes, but none are quite as good. There are some utilities written by
Alan Pratt (ls, cp, mv, and so on) on atari.archive....

Enjoy...

Well Apple's R&D just crancked out a new model today.. The Mac LC 520 is a integrated 14 inch color classic with built in dual speed cdrom, 5 megs and 80 meg HD, 1 meg video ram, and stero speackers. This model uses an 25 mhz. 030 at 32 bit bus. The mother board can be easily removed for easy upgrade.. Cost $1509..... Will only be available to education institutions and students. So much for Atari's failed attempt to get the Falcon into the education market... The LC 520 is available now!!!!!!!!

Peter Sinclair-Day University of Northern Iowa Cedar Falls, Iowa

:-)

IBM is manufacturing the Jaguar in Charlotte, NC. It's a $500 million
contract. Just got this off GEnie.

Get your fork and knife ready. :-)

06/28 1545 Atari inks $500 million contract with IBM for ...

SUNNYVALE, CALIF (JUNE 28) PR NEWSWIRE - Atari Corp. (AMEX: ATC) announced today that it has contracted with the IBM Corp.'s (NYSE: IBM) Charlotte, N.C., facility to manufacture the Atari Jaguar, Atari's new 64-bit multimedia entertainment system.

IBM's multi-year contract is valued at $500 million. The Atari Jaguar, to be made in the United States, is an interactive multimedia entertainment system which features over 16 million colors in 24-bit true color graphics and produces shaded 3-D polygons for manipulation in a "real world" in real time. A 32-bit expansion port will allow for future connection into cable and telephone networks, a digital signal processing port for modem usage and connection to digital audio peripherals. The Jaguar will also feature a double-speed compact disc peripheral.

"This system is clearly the wave of the future," said Sam Tramiel, president of Atari. "Because the Jaguar will feature such an array of visual and audio special effects, we wanted to work with a premier company that we are confident can manufacture the quality product we have developed."

The Charlotte-based IBM plant, which for 15 years has manufactured and developed products only for other IBM businesses, just recently began working with outside companies to meet their production needs. The Atari Jaguar project represents one of IBM's first entries into manufacturing for the mass consumer electronics market.

"This is a wonderful opportunity to work with Atari and their new system," said Herbert L. Watkins, director of Application Solutions manufacturing at IBM Charlotte. "Everyone expects IBM to manufacture complex information technology products, and with this, we'll show that we can competitively build a sophisticated consumer product."

In addition to assembling the Jaguar, IBM will be responsible for the component sourcing, quality testing, packaging and distribution. The Jaguar, announced on June 3, is based on an Atari-designed proprietary 64-bit RISC processor that features four times the technology currently seen in the marketplace today. The sound system is based on Atari's proprietary, high-speed, Digital Signal Processor dedicated to audio which can produce CD-quality sound.

The Atari Jaguar will be available on a limited basis in the fall, focusing on the New York market. A national roll-out is expected next

year, and the Jaguar will retail for approximately $200.

NOTE: Atari Corp. manufactures and markets personal computers and video games for the home, office and educational marketplaces throughout the world. Atari headquarters are located at 1196 Borregas Ave., Sunnyvale, CA 94089.

The IBM Corp.'s Charlotte facility manufactures and develops for IBM and other companies a wide variety of products, such as banking systems, automotive diagnostic systems and electronic circuit boards. The site includes 2.3 million square feet of work space on a 1,200-acre site. Its address is 1001 W.T. Harris Blvd., Charlotte, NC 28257. Telephone: 704-594-1000.

06/28 1401 Atari shareholders reject reverse stock split

SUNNYVALE, CA (JUNE 28) PR NEWSWIRE - Atari Corp. (AMEX: ATC) announced today the results of its annual meeting held on June 25, 1993, in Sunnyvale.

In view of the current trading value of the common stock, the board of directors recommended that the shareholders vote against the one for 10 reverse stock split. The shareholders voted against the proposal. Therefore, no reverse stock split will occur.

In addition, Sam Tramiel, president, demonstrated game software on the company's new multi-media entertainment system called the Atari Jaguar.

NOTE: Atari Corp. manufactures and markets personal computers and video games for the home, office and educational marketplaces throughout the world. Atari headquarters are located at 1196 Borregas Ave., Sunnyvale, CA 94089.

I know it is really tacky to follow up on your own posting but hey, this is
only usenet.

I just got a piece of mail from Diamond Back tech support asking me about
the problems I was having with DB2. My jaw hit the floor with surprise! I
never expected support like this. Now, I don't expect them to fix all my
problems (atari (mis)management, commuting traffic, ...) but I have
full confidence that I will recieve a satisfactory response to my
DB2 problems.

It looks like I've found another software vendor worth supporting!

>But this is a LUXURY, not a necessity (manufacturing is a necessity, by
>comparison).

Actually Rob, I don't think it would cost as much as you and Ed think.

I think it would cost under $40,000 a year to put something like this together
(including the employee to do it).

I also think that the benefits would definitely outweigh the costs.

>
>>There are very few dealers out there and some dealers do not really have
>>enough time to spend with their customers as needed.
>
> Those are pretty pitiful dealers, then.

No, not really. The Atari market cannot support large full-service dealers.
Many of these dealers are one man shops. They don't have time to spend
hours of giving people support when people from user groups have no problem
with it.

>
>>Atari User Groups _ARE_ a way to sell computers and give people something
>>that they cannot get on another platform--support.
>
> User groups are a good idea, but they have existed for long periods of time
>without any official company support.

No, I remember a time when Atari user groups received a lot of support fro
Atari Corp. I EVEN remember a time when there was an Atari user group
coordinator... anyone else?

>
>>And YES, they _CAN_ afford it. Most of what I stated will not cost Atari

>Such a "gift catalogue" idea could end up COSTING Atari more money. Even if
>you throw in Lynx owners and Falcon users and Jaguar enthusiasts, you're
>still talking about a lot of slick paper selling to a very small audience.

HEY, Sierra would not be selling their trinkents if people weren't buying them!

Also, how much FREE advertising can Atari get from people wearing their
name on their sweatshirt! Or drinking from a coffee mug on their office desk
with "Atari Computers" written on them?

The gift catalogue could be included with the Lynx, Jaguar, and Falcon030
packages. Atari doesn't have to mail them out. And not only that--if Atari
ever gets Atari Explorer going again, they can put a two page ad in this
publication for these gifts.

And I'll bring up Sierra again... I would say Atari has a much larger audience
than Sierra. And will have a gigantic audience when the Jaguar and Lynx
take off!

Do you think Nintendo and Sega are making money off of their trinkets? :)
Nah...

>
>>>> A Bulletin Board System (BBS) STRICTLY for the exchange of user group
>>>> articles, files, and information.

>of time to run. And Ed is right; it's _not_ going to get a lot of caller
>traffic. Think of how often you actually NEEDED information on running a
>user group, Len. It's not a lot.
>

Hey, I've co-sysoped a few BBS as well! And there wasn't a lot to it besides
checking the messages, files, and validating users. And if you say
you doubt there will be a lot of usage, there will be even less work!

And let's say you are right and that there isn't much demand for a BBS to
be created for user group support. Atari could still open an "official Atari
user group support" area on GEnie or another online service. Ed said there
was a user group support area, but I don't think it is an official area like
an Atari developers forum.

>
> Len, I mean this in the nicest way possible, but sometimes you're so
>optimistic about the future of Atari that even *I* wonder if you're on the
>payroll. B-) On the other hand, you also get into mood swings, and try to
>drum up massive letter-writing campaigns. "The fate of the company rests in
>our hands!"...Right, Len.

Hey, it certainly doesn't hurt! If you would send a few letters to a couple
of retailers saying that you'd like to see the Lynx better supported
instead of complaining about it on here, maybe something would change.
Think of that?

Maybe if the guy in charge of purchasing for Toys'R'Us receives a few thousand
letters, he will be more willing to listen to someone from Atari when
they want Toys'R'Us to carry it again.

As for my mood-swings, I have always been very optimistic about Atari.
But, I believe that USERS have a lot to do with keep the company going when
so many similar companies without customer loyalty have gone under.
But, I have never said "The fate of the company rests in our hands!" so don't
quote me there.
The fate of Atari is controlled by the Tramiels and Atari's employees,
but you can bet that we do carry weight.

>
> (My most favorite recent Len-ism: "Atari hasn't announced it, but a VR
>interface for the Jaguar is in the works! I'm sure it is!")

I read somewhere in an official release statement that a VR interface is
being worked on it. And, in all honesty, I wouldn't be surprised if we see
one for it within a year after the Jaguar is released. Sega has
demonstrated their VR glasses, do you think that this will be a product
that only Sega will be selling?

>
>>As for MONEY, like I suggested before, an Atari Gift Catalog would be able
>>to support this user group push. I _know_ Sierra makes a reasonable
>>amount of money selling shirts, bags, etc. I _know_ with all the Atari
>>fanatics out there, Atari could make a good amount of money on these things.
>
> Pure speculation. I wouldn't be surprised if a Gift Catalogue becomes a
>source of red ink. And if it isn't, the items it advertises will be priced
>so high that most folks will not bother to buy from it ("$25 for a T-shirt?
>Forget it...").
But you are speculating as well by saying that it will not work.
I'm majoring in marketing and I say that it will. Of course, the only way
to really find out is... to try it.

>
> If you want to really help Atari, do the following:
>
>1. Win the lottery. $10 million is nice, $30 million is better.
>2. Give it all to Atari Corp.

>3. Supervise the use of your money (on your own time) to make sure it is not
> fritted away on executive perks.
>

Actually, don't laugh. If I did win $30 million in a lottery (and I've tried
with no success), I would put some money away for myself and then I would
definitely fly to Sunnyvale.

I think I would do a Ross Perot PRIME TIME show demonstrating Atari as a major
technology company with the Lynx, Jaguar, Falcon030, etc.

:)

That sounds great, the Falcon will finally be able to view GIF's. The only thing is the resolution. I don't know about the 1024x768 on the Falcon, and alot of these GIF's do have alot of colors, I think I saw one that had more than 256, but not sure. Either way they should come out with a pretty standard graphics card for the Falcon that can display 24 bit color so developers can start programming not for the Falcons rez modes, but for the new card. I know Lexicor just released a great little 24 bit card, but I think the resolution is still kinda low. 16.7 Million colors though.

Yea, I probably won't go then.. I'll just read about it... I think what ATARI really needs is some major shows. I know we have the MacWorld Expo here in San Francisco once a year, and its held at the Moscone Center, really big, lots of vendors, everyone is there.

If only ATARI could do that, and San Francisco is a great place to have it to.. Maybe someone can suggest it to ATARI?

afonseca@terapin.com

1151. How do you use the mouse (programming) ?

Newsgroup: comp.sys.atari.st
Date: 1993-06-29 08:52:10 UTC
From: udee128@oak.cc.kcl.ac.uk

Hello,
Please could someone please help me with a small problem. I am trying
to write a program that I want to use the mouse, but I'm not sure how to go
about it. I have the ST internals book, and it says that you supply the vector
of the new mouse routine, but I don't know how much of it must be in assembly
language, and what parts. I am writting the resto of the program in C, so the
more of that the better. What I would like is a sample code segment if it is
possible, as this makes my job easier (something to "copy"/use as a template).
If any one can help me please could they either post to this news group
or mail me directly. There is a copy of the finished program for anyone who
helps and wants one. The supprise is that you don't know what the program
will/should do. Fix my problem and you'll find out (don't you just love
intrege).

Thank you in advance
JTBean

According to a Reuter news service report that I unfortunately forgot to bring home with me, Atari announced yesterday that it has contracted with IBM for the manufacture of the Jaguar games console. The story included a price estimate in the $200 range, which pretty much means no CD-ROM reader built in, but it quoted Atari Corp. as saying the Jaguar will include a 32-bit expansion port for future connections to telephone and cable television networks.

Peter:

What will it take to get through to you? This newsgroup is for the
discussion of the Atari ST/STE/TT and Falcon lines of computers. As
you may note from the words "Atari ST/STE/TT and Falcon," discussion
of Apple computers is COMPLETELY OUT OF PLACE HERE. There's a special
newsgroup for the discussion of Apple computers and their impact on
the Atari community... That place is comp.sys.atari.advocacy.

If your site doesn't get comp.sys.atari.advocacy, then I guess you're
SOL. Stop abusing the privilege.

|>
[Other stuff deleted]

The falcon demos that I have seen (one the last two months at our user group
meetings) have been pretty much flicker free... with the right monitor.
A good VGA monitor seems to display most resolutions without any noticable
flicker. However, trying to use something like a SC1224 with resolutions
other than the standard ST resolutions can really give you a headache.

Message-ID: <60.34538.4514.0N17CC2B@canrem.com>
Source record: 203813

```
-> I just recently got a Seagate ST250R hard drive. I was told that it
-> is a >40 meg drive, but I can only get about 28 megs from it.
-> Someone please tell >me if the following info is correct:
-> Number of heads: 4
-> Cylinders: 667
-> I am using an OMTI MFM controller and the Latest ICD formatting
-> software >(6.06, I think)/
->
-> From the Seagate info that I have there is NO ! ST250R, but there is
-> a ST251R, this is a 43 meg Formated Drive with 4 heads and 820 data
-> Cylinders..

I'm not sure if I'm addressing this to the right person; hope the right
person reads it...
```

Sounds like the Seagate is an RLL drive, and the controller is MFM.
This would explain why you are getting less capacity out the drive; RLL
is a very similar format to MFM, but squeezes more capacity out of the
same mechanism.

Hello, I recently bought a Falcon and there where some demo programs with it.
There was a Gif-viewer, but that one couldn't view JPG-files.
(And I thought that JPG was a compressed GIF file, so that I might have worked).
Does anyone has a JPG viewer for the FALCON?

And could you E-Mail it to me?

Cspas050@cs.edu.eur.nl

M.A.Onstwedder

I really doubt if such a beast exist. But if it DOES, I want one!

Here is a question for you people:
How long do you think I'll have to wait till I can get a descent ST system
for under $100?

Now I'm talking used. I just got a descent Atari 800 xl for $40 and I am
currectly investigating it for posible future upgrades. But I wonder what
fun I could have with a 16 bit system?

1160. GEM-View 2.30

Newsgroup: comp.sys.atari.st
Date: 1993-06-29 13:39:49 UTC
From: fiebelko@bonny.informatik.uni-dortmund.de
Message-ID: <20pgn5INNd4@fbi-news.Informatik.Uni-Dortmund.DE>
Source record: 204131

GEM-View is now uploaded to some ftp-server. Here the changes up to
version 2.30!

Today uploaded to:
o ftp.Germany.eu.net
o ftp.tu-clausthal.de
o ftp.uni-muenster.de
o atari.archive.umich.edu

- [2.30]:
o loads monochrome GIF's with less memory usage than before.
o The buffer-size for loading files can be set in GEMVIEW.INF
with an Editor. The value entered means KILOBYTES!
So, " 32 FileBufferSize"
sets the buffer to 32 kByte (the standard is 8 kByte).
o Auto convert GEM-Metafiles to Rasterimages without display.
Destination-raster-format and actual resolution is used.
Not in HighColor or TrueColor!
o JPEG version 4.0 now included. Loading 2-times faster!
Test-picture: 800 x 600 (87645 bytes), Reference: 8MHz ST
JPEG 4.0: LOAD (2'17") + Dither (0'55") = Sum (3'12")
JPEG 3.0: LOAD (4'29") + Dither (1'08") = Sum (5'37")
o Character size of GEM-View window can be chosen
(Standard font, size: 8 points, 9 points, 10 points)
o New keys supported F1 to F6
F1: white background
F2: grey background
F3: black background
F4: 8 points standard font
F5: 9 points standard font
F6: 10 points standard font
F10: "Break ^B"
o loads VIVID Raytracer images
o loads and saves Enhanced Simplex (ESM) pictures
o loads TIFF-Images with LZW-Compression
o Wildcards can now be used in Load, Conversion and Identification.
They can be used for automatic conversion of a complete directory.
Use the wildcard(s) in the filename in your File Selector Box.
Summary:
'*.*' : All Files.
'*' : All Files without any Extention.
'*.IMG' : All Files with Extention '.IMG'.
'F*.GIF' : All 'GIF'-Files, beginning with 'F'. After the 'F'
any other characters (including 0) are covered.
'F?.IFF' : All 'IFF'-Files, beginning with 'F' but the use of '?'

after the'F' means that exactly one character must follow.
'G???*.*' : All Files, having 'G' followed by 3 or more characters.
o meaning/use of '-merge' changed
o Two new error-propagation dither-algorithms:
"Jarvis-Judice-Ninke" and "Stucki"
o The Picture-Menu "GEM-View" can be opened without holding the right
mouse button, if the window is in the background.
A click with the left mouse button to it is enough.
o completly new Short-Cuts (MTOS)
o merging true color images
o xAcc2 included
o sending pictures using xAcc
o loads (X)IMG much faster
o better IFF and TIFF
o clipping faster
o in >32k-colors GEM-View does not use the virtual colormap
o Bug fixed: saving GIF to full disk
o black on black problem solved in >32k-colors
o correct iconify in 32k- and 64k-colors
o Bug in '-save...' used with '-merge' fixed

''''''

observing capital/non-capital letters, spaces and special characters.
The program will then be automatically registered in your name.
During this process you may, if you wish, instal the programs in
a directory other than the source directory. To do this, click on the empty
box below the word "Pfad:" and choose the destination directory from the
resulting selection box.

The contents of the archives (GEMVIEW.PAX, TOOLS.PAX and PICTURES.PAX)
can be seen below together with details of the subdirectories which will
be created.

Some special notes:
o A once-and-for-all depacking and installation process, which is not
dependent on your computer type, is all that is required.
After installation you can use all the files normally.
o You can start the installation from Floppy Disk, RAM-Disk or Hard-Disk.
It is, however, essential that the archives (the .PAX files) are in
the same directory as 'INSTALL.APP'.
o Before an existing file is overwritten, you will be asked for confirmation
to proceed.
o Using 'INSTALL.APP' doesn't modify the archives so you can copy this
disk after installation and send it to a friend! ;-)

If you registered an earlier version of GEM-View, and do not know your
code/key, you can obtain it as follows:-

o Send an eMail to me, with the following 'Subject:'
Register GEM-View: "#001234", "Norman User"
replacing the number by your own registration-number -see below- and
"Norman User" by your own name which must be typed in precisely,
observing capital/non-capital letters, spaces and special characters.

(You can discover your registration number quite simply.....
Run your old GEMVIEW and load the old GEMVIEW.PRG. - as if it were
an image file. When it is listed as a plain hex-dump,look to the right
of the third line to find a number preceded by '#'. This is your own
registration-number!)
OR

o Send me a letter with two CRI (international reply coupons), which
you can get at your post-office, saying that you want to know
your code/key. In this case your full name will be enough but please
write clearly and legibly!

Use the registration-number '000000' in the installation process to get
an unregistered version of GEMVIEW 2.30.
This version can then be tested for the next 14 days!

The Archives:
=============

GEMVIEW.PAX

SnapShot.Acc: A tool to snap and save all or part of the screen
or windows

OdiePack.Tif: A test-picture in TIFF format

GemView\DeskIcon\: Icons to install as Desktop Icons (mono/color)

GemView\Dither\: Files with special dither matrices for the
"Ordered Dithering" which can be set in the
"Preset" dialog or by using <ALT>"LOAD".

GemView\Dokument\: Documents(!) The English documents have not yet been
written and the German documents, to be found
surprisingly in the folder 'German', need some
updating. Your attention is drawn to 'CHANGES' for
information on important innovations.

GemView\GemView.App: An unregistered version of the principal program.

GemView\GemView.Inf: A simple INF-file for GEM-View.

TOOLS.PAX

Gem_Show\: Install GEM-View as a FILE viewer for Multi-Tasking

Gem_XAcc\: Material for sending and receiving XAcc-Messages

Gem_View\: Material for sending VIEW-Messages

Dither.11b\: A program to create dithermatrices for GEMVIEW from

''''''
```

All agreements with Cybercube Research Limited are herewith reinstated. Cybercube has been granted the right to collect and bundle registration applications on my behalf. Cybercube will send these applications to my address in Germany for registration.

Lexicor requested the right to provide customer support. Lexicor has been granted the right to explain the registration procedure on my behalf. However, Lexicor is not authorized to accept or relay any registration applications, cheques or payments.

1) The SHAREWARE versions of GEM-View may be freely copied.
These copies of GEM-View must be provided as:
a) a SHAREWARE product, and
b) free of charge.
In case the GEM-View copy is being requested by mail, a maximum $3 shipping and handling fee may apply.

2) All interested users may discuss GEM-View related topics. Efforts to explain the formalities of the registration process will be kindly appreciated. Discussions must be limited to the existing and available SHAREWARE versions. The creation of any new GEM-View forum or topic requires my prior written permission.

3) The right to accept registration applications and the handling of such applications requires my prior written permission and may be obtained if applied for. No charges greater than $1 per GEM-View copy should incur to the user due to such services.

4) I will solely and personally handle all registrations of the SHAREWARE versions. The user will, depending on the version, either receive a personalized registered copy or his personal registration key directly from me. The party that collected and bundled the registration applications will not be involved in the actual registration process.

5) GEM-View must always be provided on its own disk(s). If GEM-View is being distributed on a disk or disks containing files or applications which are not a part of the existing GEM-View package, a special file containing an appropriate copyright notice must be obtained through me and added on the same disk(s) along with the other GEM-View files. Users that obtain their copy of GEM-View from such disks still have to register their copy. It is not allowed to include the registration fee in the price of the disk containing the GEM-View package. In all cases, I require prior notification of any intentions to provide GEM-View in conjunction with other files, applications or utilities and a copy of such a disk must be forwarded to my address.

6) Any interested party may compile and distribute any form of documentation for GEM-View. Special care must be excercised to make the user aware of the fact that he still has to register his copy of GEM-View even if he acquires any such documentation.

- customers must be made aware of the additional registration.
- if the documentation is being provided in printed form: a special

notice on the cover page must be included, stating that an independend third party is responsible for the contents and that the author of GEM-View was not involved with the process of compiling the documentation.
- if the documentation is being provided on a disk or other form of electronic media: a a special notice on a highly visible area (e.g. label) must be included, stating that an independend third party is responsible for the contents and that the author of GEM-View was not involved with the process of compiling the documentation.
- If the customer requests both, the documentation and a copy of GEM-View at the same time, the distributor/retailer must make sure to avoid any suggestion or impression that the customer aquired the rights on the GEM-View program as well. The customer still has to separately register his copy. I would greatly appreciate the receipt of a sample of any such documentations made available for GEM-View users.

7) All of the above listed rules apply to the SHAREWARE versions of GEM-View only. These are (at the present date) all versions up to and including 2.30! SHAREWARE versions can be easily identified in the dialog box 'About GEM-View'.

[...]

ekrimen> In addition to assembling the Jaguar, IBM will be responsible
ekrimen> for the component sourcing, quality testing, packaging and
ekrimen> distribution.

I wonder if this means we'll be buying "Atari Jaguars" or "IBM
Jaguars" in stores... ie: if IBM handles the packaging and
distribution, will it be labeled an Atari product? Probably...

This is really good news for Atari since IBM has strong distribution
channels... I am now reconsidering my opinion that the Jaguar would
be DOA due to inadequate marketing and distribution...

It sounds like a good machine, so it deserves a fair chance in the
market, and this IBM deal sounds like that chance!

I have an American 1040STf, 1986 vintage, with TOS 1.0 (as far as I
can tell... 1985 copyright...).

I downloaded Llamatron and Revenge... from the atari archive but can't
get them to work... They go to the opening screen and then bomb.
Dark Castle does this too...

Why is this? Is it my TOS version? Or some other problem?

thanks for any help...

1163. Assembly '93 - A Demoparty in Finland (30 July - 01 August)

Newsgroup: comp.sys.atari.st
Date: 1993-06-29 13:54:19 UTC
From: eye@snakemail.hut.fi
Message-ID: <EYE.93Jun29155419@delta.hut.fi>
Source record: 204128

Here is some information about a demo party (for Amiga, PC, Atari,
C64) held in Kerava in Finland during 30th July and 1st August.

Please DON'T reply to me, I have nothing to do with the organising of
this party. I just got this piece of information frommy friend.

ASSEMBLY '93 THE SECOND PHASE - BE THERE OR BE ELSEWHERE!

ASSEMBLY '93 - THE SECOND PHASE

(30 July - 01 August)

THE MOVEMENT - ACCESSION - COMPLEX

FUTURE CREW

AGGRESSION

EXTEND

Last year the Assembly was a success, the weather was perfect and
we had a great time. The party, tripling the previous visitor record
in Finland, was with no doubt the biggest party in Finnish history.
This year we have made many improvements and we hope that we will
have as good weather as we had last year and to see you all there
again.
The Assembly '93 is arranged by The Movement, Accession and Complex
(Amiga), Future Crew (PC), Aggression (ST) and Extend (C64). The
partyplace is a school in Kerava (Finland) and the party starts at
10:00 in the morning on Friday the 30th of July and ends at 18:00 on
Sunday the 1st of August.

HOW TO GET THERE:

First of all, coming to Finland from outside Scandinavia should be
quite simple if you do like this: Come by car or along with one of
the bustrips (cheapest ways) and first drive to Fredrikshavn or
Copenhagen in Danmark and take the short boat trip to Sweden. Then
drive to Stockholm and take another (day/night) boat to Helsinki
or Turku (Finland) and drive to Kerava. When you return, do the
opposite and everything will do well. When we organized the bus-

trip (2 busses) from Finland to The Party II in Danmark, the price went as down as to about 90USD per one person. So, the more people you have in your bus, the cheaper all the travelling costs should be. Read more about the bustrips from the BUSTRIPS.TXT file.

Kerava is located 20 kilometers outside Helsinki and only 10 km from Helsinki airport. The partyplace is called 'Nikkarin yl{aste' and the address is Keskikatu 3.

If you don't come by car it is easiest to first get to Helsinki and then take the local train K, R, H, N or T and get off at Kerava. The train trip takes about 30 mins. From the station in Kerava it is a 400 meter walk to the partyplace. Maps will be at the train-station.

If you come by car then first get to Helsinki and drive out from Helsinki to the North-East on Lahti-highway (E75). Get off the highway at Kerava and make a left turn from the next intersection. Then it's just to follow the signs we have put up and to go with the flow. If you want maps then contact us.

If you come by plane then just take a taxi to the partyplace. It will cost you about 70 FIM. If you can't afford that, then call our Assembly hotline during the party and tell us your location and we will pick you up.

We can also provide some kind of taxi-service for foreigners free of charge. So just phone us in advance and tell us when and where you will be in Finland.

COMPETITIONS

As always on these kind of meetings, there will be some compos. We'll have the traditional Demo-, Gfx-, Music-, R-Time- and Intro-competitions and some other compos like Frisbee-, Soccer- and Disk-throwing competitions (Last year a C-64 guy set the World Record to 72.539m, nearly disqualified for not having an Anarchy demo on the disk). This year the disk must contain a Kefrens demo according to the recent changes in rules.

The competitors have to be present at the party in order to attend the competitions and to receive the possible prizes.

The voting system we will use will be introduced at the party.

The competitions are shown on a big screen and we have a powerful 4 channel Surround Sound System.

We would like to thank Suomen Hi-Fi Klubi Oy Ltd. for the sound equipment and Pro A/V Oy Ltd. for the great Sony data projector.

RULES AND PRIZES

AMIGA

All Amiga competitions will be run on a A500, KS1.3, 0.5Mb chip and
0.5Mb fast memory.

Amiga DEMO: One group may release several demos.
Amiga MUSIC: Must be an executable file. Only one tune/person.
Amiga GFX: Picture must be an IFF picture loadable in DP 3.0.
Only one picture/person.
Amiga INTRO: The intro must be less than 40960 bytes(40kb).
Amiga R-TIME: Must be executable and made in 5h out of scratch.

All contestants must be at the party. All productions will be spread
immediately after the competitions.

The Amiga prizes are:

DEMO INTRO MUSIC GFX R-TIME
1st 10000 2000 1000 1000 1000
2nd 6000 1200 600 600 600
3rd 4000 800 400 400 400
----
total 20000 4000 2000 2000 2000 = 30.000 FIM
==========

There will be some hardware prizes too, we don't exactly know yet
what they will be.

PC

All the PC competitions are run on a standard 486/33 with a Tseng
ET4000 VGA board (NOT Local Bus). All major soundcards are supported.
If you have a rare sound card be sure to bring it with you.

PC DEMO: Must work on our competition computer. We do not spread
the demos at the party if we are not allowed to. You will
have a chance to run/test your demo before the compo.
You can support more than one sound card. 20 min/demo.
PC GFX: Any standard EGA and VGA mode supported. Also 320*400*256
mode. Only one picture/person. No SVGA.
PC MUSIC 1: 4 channel Pro Tracker format. Only one tune/person.
5 min/tune.
PC MUSIC 2: Up to 32 channels. Bring your own player! Only one
tune/person. 5 min/tune.
PC INTRO: Maximum size is 100kb executable. All intros will be
spread at the party. 5 min/intro.

The PC prizes:

We have about $2700 US (15000 FIM) to share to the TOP 3 demos in the
demo compo. This money will be shared based on the percentage of the
votes the demos gain.

In the other PC-compos we will give away all kinds of hardware and software prizes which will be given to us by our nice sponsors. These prizes include for example: Gravis Ultrasound cards and other sound cards, harddisks, games, CD-ROM disks, joysticks, computer related books, complete F-PROT & Dr. Salomon's viruskiller packages and more!

The official sponsors in the PC competitions are:

* Epic MegaGames (USA)
* Advanced Gravis Computer Technology Corp. (Canada)
* Pro Component Oy Ltd. (Finland)
* The Waite Group Press (USA)
* HiCompu Oy Ltd. (Finland)
* Data Fellows Oy Ltd. (Finland)
* Toptronics Oy Ltd. (Finland)
* Lan Vision Oy Ltd. (Finland)

ATARI ST

There are only two main competitions for ST, demo and graphics.

Atari musicians can compete in the Amiga competition. Due to the rules on the Amiga only 500kb of samples is allowed. The module must be in Amiga or Atari executable format.

Both main competitions will be run on an STe with 1 Mb of memory.

Atari STe DEMO: One group may attend with several demos. Demos must be 100% finished and we will spread them.
Atari STe GFX: Picture must be an executable file. All copied pictures will be disqualified.

The ST prizes are:
DEMO GFX
1st Atari Falcon030 2000
2nd other hardware 1000
3rd other hardware 500
---
total about 20000 3500

There may be some other hardware prizes too.

The official sponsor in the ST competitions is:

* OY ION Finland (the official Atari importer)

C-64

On the C64 we have demo and music competitions. The prizes are percentages of the entrance income. About 3000-5000 FIM.

DEADLINES

All the deadlines are at 15:00 on Saturday the 31 of July. (But of course cool demos by famous groups can be let in after the deadline.. ..NOT!) The competitions are all held on Saturday the 31st of July and Sunday the 1st of August.

FEATURES AT THE PARTY

Cafe:
The Cafe will be open 24h a day and will sell all kinds of munchies: Coke, coffee, breakfast stuff and all kinds of kwixnax.

Techno:
Dance Nation(Captain/Frantic) and the Mighty Rubberboots(Damones) will appear in our show. Frantic has made some interesting computer animated videos for Dance Nation and of course these will be shown.

Planet FunFun!:
In Kerava you will find Scandinavia's biggest inside amusement park called 'Planet FunFun', it opened less than one year ago. At night the place works as a big disco/bar.

Central TV-system:
There are TVs all over the partyplace showing the party schedule, general information and important announcements.

Party T-Shirts:
The most Fashionable T-Shirts will be sold at the party.
(NOT AVAILABLE IN ANY STORES!)

Online BBS:
There will be a party-BBS online at the partyplace. It can be phoned during the partytime, not before and not after! The number can be found on our boards a few weeks before and during the party.

Assembly Hotline:
You can call your friends at the party, or to get some information about the results, or just to chat with the organizers.

Movies:
The newest ray-trace movies will be shown on the big screen.

Assemby '93 Movie:
Assembly the movie will be made at the Assembly.

Game competition:
Terra Marque, a game-company consisting of the 20 most elite guys in the finnish Amiga scene, will show a playable preview of their forthcoming Elfmania-game. Naturally there will be a competition with suprise prizes.

Showers and quiet sleeping places:
Yes!

Weather:
Expert meteorologists agree that the weather in Kerava will be sunny,
the temperature will be at least 25 celsius and babes will wear
extremely short miniskirts!

The entrance fee is 100 FIM and can not be payed in advance.
(No pre-announcement is needed.)

FOR EVEN MORE INFO CALL OUR BOARDS:

WASTED TIME - +358-0-5053602
and +358-0-5053101

STARPORT - +358-0-8044626
and +358-0-8041133

And don't forget to call our online BBS during the party!

OR CALL THE ORGANIZERS BY VOICE:

>Lexicor just released a great little 24 bit card, but I think the resolution is
>still kinda low. 16.7 Million colors though.
>
>afonseca@terapin.com

GIFs, by their very specification, can't have more than 256 colours -
honest. JPGs, MPGs and a few other formats (is the PC .BMP one of
them?) have 24 bit colour.

Presently the Falcon can have 65535 colours on screen in it's so
called 'True Colour' mode. This, unfortunately, isn't enough for
professional graphics work and is a problem Atari should work on (but
probably won't)

That said, 65535 (or even 256) colours give extremely nice results for
home users and are more than enough for any gamer's out there. I don't
know if you get the UK Magazine ST Review but the first two Falcon
games (both graphical adventures) have just been released over here.

1165. GOFER for the ST

Newsgroup: comp.sys.atari.st
Date: 1993-06-29 15:11:19 UTC
From: spoil@cs.tu-berlin.de
Message-ID: <20pm2n$5ru@news.cs.tu-berlin.de>
Source record: 204136

To whom it concerns:

I just compiled the current version of GOFER (2.28b) for the ST.
It does not yet use any MiNT-specific calls, but will do so in the near
future. So for all of you who want to experience a funcional programming
language, GOFER, a Haskell-interpreter might be your choice.

The package includes the GOFER interpreter and the GOFER->C - compiler.
It is available via FTP from nebula.cs.yale.edu, directory
pub/haskell/gofer, file st_gofer.zip.

Regards,
Laurenz

1167. FalconScreen via FTP ?

Newsgroup: comp.sys.atari.st
Date: 1993-06-29 15:27:46 UTC
From: m2ac@ohm.york.ac.uk
Message-ID: <1993Jun29.152746.9218@ohm.york.ac.uk>
Source record: 204141

Does any one know if FalconScreen, the PD Falcon screen extender, is available via any of the anonymous access FTP sites? I've looked in the atari.archive mirror at src.doc.ic.ac.uk but it's not there. Is it available anywhere else ??

Thanks

Andrew Crowley

I think the fest (I mean all computer/videpgame fest) seem to fading/failing.

The world is becoming asorbed by Intel compatable equipment. (lets face it,
who is IBM compatable anymore?) These user groups are losing a great number of
people to 486s. The hammer fell in 89-90. The only thing companies can learn
from fest these days is "now or never". I'm sure Atari and Commadore knows
this, but are they in a position to do anything about it?

A friend of mine just got his falcon last week!!!! It is amazing! I definately have to get one. I have a couple of questions. First I was helping him set it up, and noticed it did not come with Atari Works? I thought it was being shipped with the Falcons. Also I noticed that gemview looks beautiful on the falcon for those interested, can anyone recomend any other good graphics programs? I am thinking abou getting True Paint does anybody know how good/bad it is?

John

1170. Atari/IBM joint venture

Newsgroup: comp.sys.atari.st
Date: 1993-06-29 18:08:38 UTC
From: mauritz_c@spcvxb.spc.edu
Message-ID: <1993Jun29.140838.6465@spcvxb.spc.edu>
Source record: 204149

This is the best news for Atari in a long long time. I'll give credit where it's due. Atari finally wised up that they do not have the ability to manufacture sophisticated computers in quantity. They are leaving all the the production and outsourcing to IBM, who has plenty of production capacity at this point. :)

Cheers,

Chris

No, that is not what it said. It said that Atari would offer a
CD-ROM **peripheral**, meaning that it is not part of the unit.

Cheers,

Chris

This is also good news for Atari, because as far as I know they don't have any large production facilities left - and because IBM *are* IBM, and I don't think they'll be fooling around instead of producing the Jaguar when it's due!

> It sounds like a good machine, so it deserves a fair chance in the
> market, and this IBM deal sounds like that chance!
Sounds like Atari Corp. saved its skin one more time... Could be a big succes, let's hope so!

Glendale IS one of the major Atari shows... and you should try to attend. If
you are waiting for a larger show, you might have a l-o-n-g wait indeed.

>I know we have the MacWorld Expo here in San
>Francisco once a year, and its held at the Moscone Center, really big, lots of
>vendors, everyone is there.
>
>If only ATARI could do that, and San Francisco is a great place to have it to..
>Maybe someone can suggest it to ATARI?

Sure, if Atari was the world's largest computer manufacturer (as Apple now is)
they could do that easily. The fact is that Apple has more registered devs
than attendees at the largest Atari show. OK, that's not a fact, just my
assumption, but I'll bet it's not far off the mark. At any rate, it's time to
wake up and smell the roses, people. Atari is a small company with a small
number of employees and a small user base. We might wish otherwise, but they
can only do so much with the resources they have. In the meantime, just sit
back and ENJOY your Atari computer. Things could be worse, ya know? :)

Yeegods. Inconceivable! Who'da'thunk that IBM would actually help to sell
something at an Atari price?

Atari might not be totally dead yet, but they could certainly be in for some
mind-numbing changes if IBM is teaming up in any other ways...

>--
> Ed Krimen

Impressive. Thanks Ed for letting us know over here. I guess GEnie has
its good points!

Also, there is a small write up in today's Wall Street Journal about
Atari's shareholders NOT approving the 10 for 1 reverse stock split. This
was after the company changed its position when Atari's stock went above $2.00.
It also mentions the deal.

I'm kind of surprised it is a $500 million contract. This an awful lot of
money. I'd like to know more.

Symbol Searched: ATC

6/28/93 Atari, IBM -2-: MultiMedia System Due Out This Fall

>ATC

SUNNYVALE, Calif. -DJ- Atari Corp. (ATC) said it has

contracted with International Business Machines Corp.(IBM)

for IBM to manufacture the Atari Jaguar at its Charlotte,

N.C., facility.

The Atari Jaguar is a 64-bit multimedia entertainment

system.

In a press release, the company said IBM's three-year

contract for the order is valued at $500 million.

The Atari Jaguar, to be made in the United States, will

be available on a limited basis in the fall, focusing on

the New York market. A national roll-out is expected next

year, with the system retailing for about $200, Atari said.

In addition to assembling the Atari Jaguar, IBM will be

responsible for the component sourcing, quality testing,

packaging and distribution, Atari said.

The company said the Atari Jaguar is an interactive

multimedia entertainment system with 24-bit true color graphics.

The company said a 32-bit expansion port will allow for future connection into cable and telephone networks. A digital signal processing port will allow for modem usage and connection to digital audio peripherals. The Jaguar will also have a double-speed compact disc peripheral.

Well, this makes a lot more sense. Not so much a joint venture as that Atari has subcontracted the production of its system. To an American maker, instead of Taiwan or elsewhere, even. Slick...

Hi,
My C partiton on my hard drive was screwed up after I install
a Minix file system on my G drive.
I used ST tools to look at the first few sectors of the C
partition and found that some of my old file names are still
there althought when I open up C drive, I see a file with
weird name. This led me to think that the 2nd copy of the FAT
is still ok. Can someone tell me how I could replace the
corrupted copy of FAT with the old one if this is possible?
I remember that someone send a long procedure of recovering
disk on to the newsgroup before but I couldn't find it anymore
althought I saved it. Can someone who recall send it to me
again too?

Thanks a lot. Please e-mail me. I want to get my machine up
and running and install mint as soon as possible.

>
>I wonder if this means we'll be buying "Atari Jaguars" or "IBM
>Jaguars" in stores... ie: if IBM handles the packaging and
>distribution, will it be labeled an Atari product? Probably...

It should still bear the Atari name, I believe. To say "IBM is responsible for packaging" probably means the IBM facilities will box the units there, and ship them directly to the stores. What is more interesting is if IBM has a say in the Jaguar's promotional efforts or not...

>This is really good news for Atari since IBM has strong distribution
>channels... I am now reconsidering my opinion that the Jaguar would
>be DOA due to inadequate marketing and distribution...

Distribution is taken care of. But marketing? That's still up in the air.

Oh, more facts about the Jaguar, from the latest issue of Atari Explorer On-line, Atari Corp.'s official electronic magazine...

^^

The Jaguar comes with two megabytes of RAM, a 64 bit custom RISC processor, and a full 64 bit bus. The DSP chip is not a Motorola DSP as in the Falcon030, but rather a Atari custom DSP chip that is a subset of the RISC processor. There is a cartridge slot on top of the Jaguar case, which will also serve as a connection point for the Jaguar CD ROM unit, which will in turn have a cartridge port for "piggy backing" cartridges into it. Several shareholders commented on the capabilities of the Jaguar that appear to exceed what many computers have, and Sam stated that consideration was being given to creating a Jaguar PC card as well as using Jaguar technology in future Atari Computers like the Falcon.

^^

Have fun,

Source record: 204018

Hi all!

Yesterday we discovered a really bad mistake the desktop has, when you switch to interlaced and watch it on TV (at least MY TV, which is a pretty good and new one). What happens is the following:
Some lines seem to be swapped. Put two windows with text on the screen, one of them ONE line below the other. If you also have the bug, one of the texts will flicker terribly, the other won't. Would be nice if you could check this, and tell me, so that I know wether it's only my TV or a bug in the falcon.

Well I was able to fix that bug for my TV and am thinking about a little patch-program that will fix that bug for everybody, if you are interested!

So, tell me!

Cheers
Michael Eberl

> Hello!

> Does anybody know whether there is a /FALCON/ Software-Modem available as it is
> explained in ATARIs advertising?

An american company is working on such software, including voice-mail,
a FAX-modem and several other goodies. I don't know if it is finished yet,
but it was supposedly demonstrated at the CeBit fair. I haven't heard of
other software modems for the Falcon, but source code for the DSP exists
which does that. It's in the Motorola BBS archive, which can be found a.o.
on the site src.doc.ic.ac.uk.

> What other special programms for the /FALCON/ are available, especially pd and
> shareware?

I don't have a Falcon, so I'm not really up-to-date, but I know that there
are at least some harddisk recording programs, at least one freeware program
that allows custom screen modes on the F030 (over 800x600 with reasonable
vertical frequency), and quite a few demos. Have a look on
atari.archive.umich.edu and ftp.tu-clausthal.de as well as some other german
ftp sites for Falcon software!

The Software Modem is being worked on by a third party at the moment, I believe
and you can get some pretty reasonable pd/shareware s/w from the a.a.u.e
archive in the Falcon directory, or use on of its mirrors.

You left out:

3) Bozo company - can't deal on good terms with _customers_ OR _dealers_
4) Availability - well, nobody really carries Lynx anymore; the Fall-con
isn't visible anywhere

If you think the Jaguar will be any different from _every_ machine
Atari's released since c.1985, that's your problem.

No, this is where you get the source code, documentation, and sample files; I asked the POV team about a year ago if I could release (and upload to GEnie, atari.archive, and their archives on alfred, etc) an Atari 68000 and 68030/68882 version of POV-Ray.

They still haven't said yes or no. They said, "Somebody else is porting it, we'll have to contact him and get back to you." Hmm, I wonder exactly what the other guy is doing; it compiles without modification under GNU C, and with _one_ change under Pure C.

Thanks for your reply Robert... There are indeed no sites that I can find
either via this enquiry or Archie.
I'm sure we would all like to see it posted... an ftp site would be the most
useful.
There do seem to be problems with IFFs, TIFFs, GIFFs, IMGs, and IMs.. but
then thats another line of enquiry.
Thanks
Philip

Roy:

JMG Computers is an Atari dealer; they even write their own Atari software (HyperLink). I believe they are located on Upper James, but check your phone book.

Regards,

Mike.

Er, where have you been, Rob? Gemulator is a board/software combination that fits in a short slot of any 386-486 PC to allow it to run Atari ST software (courtesy of the TOS 2.06 ROMs on the board). It's been available for some time now and was developed by Darek Mihocka of Branch Always Software. You can contact him on the net at darekm@microsoft.com .

>Here is a question for you people:
>How long do you think I'll have to wait till I can get a descent ST system
>for under $100?

Depends on what you mean by "system." If you mean strictly the cpu, then I'd think you could find a 520ST right now for $100. If you want a monitor, external drives, and all the trimmings... well, forget it.

1208. Help with Desktop Replacement

Newsgroup: comp.sys.atari.st
Date: 1993-06-30 14:52:07 UTC
From: skolodzi@vaxc.stevens-tech.edu
Message-ID: <1993Jun30.095207.1@vaxc.stevens-tech.edu>
Source record: 204030
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

I started to write a desktop backgrond replacement program and ran into problems, I am looking for help.

I was tring the simple minded idea of using a wind_set(W_NEWDESK,...) to replace the defualt desktop. This does not work totally. What I get is my own desktop drawn with all windows drawn on the desktop updateing perfectly. The problem lies in the fact that I "THINK" the root of the Desktops Object Tree has the standard desktop, and then all of the desktop icons/dialogs, etc... hang off of that tree. This means that since I replaced the desktop tree with one object (my desktop picture) non of the objects in the default desktop tree (such as the drive icons) are displayed?

Is there a clean way to overcome this deficency? I have looked at some desktop replacement code and it seems to replace the GEM-VDI vector with a bit of code that checks to see if a area_fill of the right type is being done on the desktop, if it is then the code draws the portion of its picture instead, and returns; otherwise if the trapped VDI call is doing something else, then jump through the VDI's old vector that was replaced. This seems like an ugly solution?

Any help would be appreciated.

Cheers,
Scott Kolodzieski

Er, I don't wish to burst anyone's bubble here folks, but you _really_ do need to come back to earth and read the press release very carefully.

Consider... a $500 million contract for IBM to build Atari Jaguar game consoles set to retail at $200. That's a heck of a lot of Jaguars to build at what, ~$70 Atari's cost? Gotta leave room for distributor/dealer profit. Will 3DO stand still? Will Sega? Will Nintendo? I don't think so.

Bottom line is that the 3-year contract is _valued_ at $500 million but only if market predictions hold true and Atari pays its manufacturing bill. The BEST thing about this announcement is IBM's involvement who will have a vested interest in trying to make sure Atari does NOT screw it up. :)

If the venture is financially successful for Atari, I would not automatically assume that the computer division will reap the rewards earned by the game division. "Business is war" says Jack, and if the computer division is losing money and the game division is raking it in, what would YOU do?

Optimism is great, but a touch of realism makes it even better. At any rate, I hope they pull it off. It would be great to see Atari on top again.

You can use DJPEG_ST on your Falcon; I tried it out on the demo
unit at the local Atari dealer. When I get my Falcon the first thing I am
going to write is a really FAST JPEG decompression program specific to the
Falcon. BTW JPEG format has nothing to do with GIF format....

>recomend any other good graphics programs? I am thinking abou getting
>True Paint does anybody know how good/bad it is?

For showing/converting images ImageCopy2 is *very* good and costs
about 20ukp from the ST Club, 2 Broadway, Nottingham, NG1 2PS, England
+44 602 410241. It's very much faster than Gemview but lacks the JPG
format.

I've not seen Truepaint but the reviewers have all liked it - reading
between the lines I'd say that it's a 'Degas for the Falcon'. Not
exactly spewing out professional features but very good at what it
does.

The real question is "What will Atari do?"
Answer: Damned if I know!

When everything is considered Atari should have shutdown its computer
division years ago and focused on what it did best, GAME machines.
Now if they've figured anything out from the Lynx it should be that
when advertised it sells.

Brian

BTW the local Electronic Boutique had a one week sale on the Lynx,
the deluxe package, for the price of the stand alone unit, $89.00.
They sold out their stock in less than one week before they noticed
someone had miss marked the deluxe package with the standalone price :)
Though they were happy to have sold 15 Lynxes in one week.

I really wonder what will happen to Falcon development... But hey,
I got a Super Nintendo and I'm all in for Atari making a super-killer
machine, which the Jaguar appears so far to be.

I think Atari's greatest challenge now is to do AWESOME software that
will show this machine's capabilities + start building marketing hype.

I guess 3DO people must be kind of scared... I though the Jaguar, as
with almost all latest Atari products were vaporware, but now that they
signed with IBM for manufacturing...

1218. KC Fest report - long

Newsgroup: comp.sys.atari.st
Date: 1993-06-30 17:56:00 UTC
From: trek@cbnewse.cb.att.com
Message-ID: <C9G4HI.7nM@cbnewse.cb.att.com>
Source record: 204044

The Kansas City Atari Fest had light but steady traffic Saturday. Show organizers noted that only 4 or 5 of the advance tickets had been used (and my party accounted for 3 of those) so were hoping for a much larger attendance on Sunday. I only stayed Saturday so can't comment on Sunday.

Those who did attend were rewarded with demos of some of the newer software, plenty of Falcons in attendance - and even ones you could buy and walk out with there at the show (despite some of us with advanced orders still not having received ours - :^(( ), and a chance to talk with both developers and sales people in a leisurely fashion.

Calico was there with version 3 of Shanghai, the oriental game where you remove paired tiles where both tiles of the pair match and are not connected to the rest of the diagram by more than one block at the same level. Version 3.0 offers dozens of tile configurations, tile faces, and background pattern - all user configurable.

Toad Computer was there selling their broad range of software and hardware (but no Falcons.)

Some of the dealers who were going to show just had reps there. Among those were Clayton Walnum (so I still haven't met this very prolific writer who has helped me to enjoy my Atari more) :^(, Migraph (but they did have some attractive show prices for their scanners), MissionWare (Flash II folks) and a Pagestream rep, and ICD who were represented by two dealers.

And some didn't show - American Technivision.

Oregon Research was there with Motorola 680x0 and DSP manuals, the HiSoft software that they distribute (like Devpac 3.0) and Lattice C 5.5. Lattice C 5.6 (geared for the Falcon with DSP support) is still a month or so off. They were providing upgrades for their products if you were registered or had your disks with. I did ask if there was any support for C++ and Bob wouldn't say that they will be distributing Comeau C++ front end but he knew an a whole lot about its progress, expected availability, etc. I took it that negotiations are still on-going but look for this great new product - Falcon compatible - in about 6 months. They were also showing True Paint on the Falcon. I'm an old 8 bitter also and finally think some of these new graphics packages are eclipsing what is possible despite Jeff Potter's efforts.

Lexicor was there and I spent a couple of hours getting the complete run down on all of their packages. This software is really quite impressive and would make an animator's/engineer's job easier. The discounts on

their products was very good (and yes, I bought a couple of the programs.)

SKWare One, the makers of Seurat were there offering demos and good show prices, Seurat - a terrific graphics package, an IMG viewer and Color Scan, a package that allows a hand scanner to capture color images. All of these packages look really super on the Falcon. Seurat has some really fine transition options (transitions between pictures) in the slide show arena. It is much more than that but I haven't noticed the other packages giving as complete a treatment of transition options as I noticed on Seurat. I still have to get through the on-disk manuals - some 48 pages worth.

I also saw a video from Its All Relative on the Kodak photo CD interface (forget whose table that was, either Lexicor or SKWare). This is one to really look forward to. They had flyers and were taking orders.

Two of the Codeheads were there selling upgrades to their software and demoing some of the software that they distribute, like Calligrapher. It's nice to get to meet the programmers and have the time and chance to talk with them face to face.

Dorothy Brumleve was there with her full line of educational and child oriented software. Any of you with youngsters (2-3 yr old on up) should be checking out this software. It's very appealing to children. Dorothy has struck the right combination of rewards and eye appeal to grab a youngsters attention while at the same time teaching them something useful.

John "Hutch" Hutchinson from Fair Dinkum had a table next to Dorothy. That made a nice pairing since some of John's software will appeal to a slightly older audience (Cryptographer, Word Search and Cross Word Creator). Still kind of an educational vein - and for fun, of course there is the HoverJet - and contrary to some reports, my son reports its definitely Falcon compatible!

Clear Thinking was there with Edhak upgrades to 3.0. I haven't gotten through the documents yet but it appears to have both improvements and corrections to make it more compatible with other software.

Falcon specific software - Silmaris's TransAnarctica and Ishar, The Legend Continues, and Musicom at Systems for Tomorrow (he was also the dealer with Falcon's for sale.) Guess he begged Atari for a special shipment so he could have something for sale at the show since he was the local vendor. They were 4M+65Meg HD going for $1250. (Now I am worried that not all of the more recent 4M Falcons have the 84M HD in them - and knowing my luck, I will get one of the ones with the smaller HD. :^(((They also carried several new titles for the ST. (Could it be that the Falcon is reviving some interest in producing software for the ST also???) I saw Chaos Engine, Caesar, and Lemmings II, Reach for the Skies (battle of Britain) and others we don't remember. Lemmings II is really great and is not as much as a follow-on as another new shot at Lemmings. Lots of new things to learn with it. Caesar is a "simcity" set in Roman times and you'd better recall your Latin (or Roman history) to do well at it.

TransAnartica is a train simulation that my son plays for hours. It is available in ST and Falcon versions. The noticeable differences were the graphics on the Falcon were much more detailed - check out the cars on the train, and the game seemed a bit snappier (but that might have been from trying to concentrate with all the other distractions around. Ishar read like a roll playing game but I didn't give it a shot. Musicom is Compo's software to play with sound. It allows Karaoke, direct to disk recording and special effects. I heard it on the Falcon but with very small speakers attached. You could pick out reverb but some of the other effects were too subtle to pick up on small speakers (especially when I didn't know what I was looking for - I'm not musically inclined.) Systems for Tomorrow said they should have bought in the large stereo speakers but also were wary of overtaxing the room the show was in.

Gribnif was in force and was upgrading their packages and demoing software on the Atari. Cardfile 4.0 is an improvement over 3.0. You should take a look at it if you are needing an index card type database. By the way, they are very upstanding folks. They had overcharged me $5 for my upgrades and a little later during the show I was called back to their table and presented with $5 and an apology. Very honorable indeed. I have always enjoyed doing business with them (and have every one of their products.)

Mark from Mars Merchandising was there. He was the only person with any 8 bit software (American TechniVision didn't show), with Lynx games, and also had ST games. He's one of the Chicago Suburban dealers.

Next to Mark was my local dealer - Don from Compu-Seller West. He provides some of the finest repairs and installations on Atari equipment that you will find. He carries both hardware and software. He also carries MacSee, the ST software for transferring files between Mac and Atari format. (A new use for the software was found at the show - musicians can use it to exchange files with their Mac counterparts (for those few musicians who haven't yet heard about the Atari - or more likely, can't find a local dealer. :^).))

There were a couple of tables with midi/music software - which I didn't really visit so can't comment on them, a table from the local Atari User's group at which my son picked up some used ST software, a table with fonts and graphics from Electronic Spinster Graphics.

Overall, I was impressed with what I see coming for the Falcon. The quality of the software is top-notch, thus far. Don't know if that is the hardware making it easier for them to be that way - or just market selection limiting the efforts to really worthwhile apps. On only one monitor did I notice any flicker. Sorry, I don't recall monitor and screen resolution at the time. I felt both glad and sorry that there weren't more people attending. Glad because I enjoyed the time I spent with the vendors. They were all very helpful - and I did come home with several more items than I thought I would have (thank goodness for plastic and loving wives.) This was a first time show and our hosts, KCAC did a good job advertising and hosting the show. I was saddened that the aisles weren't packed all the time - since it means that Atari

really has a long way to go in the Kansas area. There were a few of us out-of-towners (that was a 10 1/2 hour drive for our group) but I take it most were local.

```
Well,
Here's a little info on how Atari stock has done today following the
joint announcement by Atari/IBM:
Opened @ $3.00/share
1pm @ $3.93/share
Who knows WHAT it'll close at...

Later,
Bernard

FOR IMMEDIATE RELEASE

ATARI AND IBM ANNOUNCE STRATEGIC MANUFACTURING
CONTRACT FOR MULTIMEDIA ENTERTAINMENT SYSTEM

June 28, 1993 - Sunnyvale, CA -- Atari Corporation announced today that it has contracted with the IBM Corporation's Charlotte, North Carolina, facility to manufacture the Atari Jaguar, Atari's new 64-bit multimedia entertainment system.

IBM's multi-year contract is valued at $500 million.

The Atari Jaguar, to be made in the United States, is an interactive multimedia entertainment system which features over 16 million colors in 24-bit true color graphics and produces shaded 3-D polygons for manipulation in "real world" in real time. A 32-bit expansion port will allow for future connection into cable and telephone networks, a digital signal processing port for modem usage and connection to digital audio peripherals. The Jaguar will also feature a double-speed compact disc peripheral.

"This system is clearly the wave of the future," said Sam Tramiel, president of Atari. "Because the Jaguar will feature such an array of visual and audio special effects, we wanted to work with a premier company that we are confident can manufacture the quality product we have developed."

The Charlotte-based IBM plant, which for 15 years has manufactured and developed products only for other IBM business, just recently began working with outside companies to meet their production needs. The Atari Jaguar project represents one of IBM's first

entries into manufacturing for the mass consumer electronics market.

"This is a wonderful opportunity to work with Atari and their new system," said Herbert L. Watkins, director of Applications Solutions manufacturing at IBM Charlotte. "Everyone expect IBM to manufacture complex information technology products, and with this, we'll show that we can competitively build a sophisticated consumer product."

In addition to assembling the Jaguar, IBM will be responsible for the component sourcing, quality testing, packaging, and distribution. The Jaguar, announced on June 3, is based on an Atari designed proprietary 64-bit RISC processor that features four times the technology currently seen in the marketplace today. The sound system is based on Atari's proprietary, high-speed, Digital Signal Processor dedicated to audio which can produce CD quality sound.

The Jaguar will be available on a limited basis in the fall, focusing on the New York market. A national roll-out is expected next year and the Jaguar will retail for approximately $200.

Atari Corporation manufactures and markets personal computers and video games for the home, office and educational marketplaces throughout the world. Atari headquarters are located at 1196 Borregas Avenue, Sunnyvale, California 94089.

The IBM Corporation's Charlotte facility manufacturers and develops for IBM and other companies a wide variety of products, such as banking systems, automotive diagnostic systems, and electronic circuit boards. The site includes 2.3 million square feet of work space on a 1,200-acre site. Its address is 10001 W.T. Harris Blvd., Charlotte, North Carolina 28257. Telephone (704)594-1000.

I'm looking for CAUTILS, a set of music utilities from Craig Anderton,
and MIDImate, a DA for MIDI stuff. If you know where I can find
either or both, please let me know (email is fine - bobhays@spss.com).

Thanks and have fun! - Bob

^^

>Er, how do you do this without additional hardware when standard ST Low
>Res is 320x200x16 colors and Medium Res is 640x200x4 colors?

Via fancy software tricks. There's paint programs out there that can get
256 colors out of low-res, and 16 out of high-res. Some games I have do,
too. You just have to jigger the hardware display a bit... sort of like
a "Display List Interrupt" on the old Atari 8-bits. Software that does
this (and then some) includes _Spectrum 512_ (a paint program offering
512 colors in low-res, but there are limitations on scan lines, i.e.
only so many colors per line, but you still can get 512 colors on the
screen at once), and some European import paint program offered by
MichTron that promises *4096* colors in low-rez, 256 or something like
that in high rez. I haven't seen it work-- it says "for unmodified 520
and 1040STs!". However, I *have* seen Spectrum 512, and yes, it does
give you 512 colors at once, low-res, no additional hardware.

Hell, even DEGAS Elite can display 256 (or is it 512) colors low-res.
Just select "Choose" or something like that under the Colors menu.
Whammo, loads o'colors-- but you can only use 16 at a time. If I was a
real artist, I would have purchased Spectrum 512 a while ago. Think it's
still out there-- try E. Arthur Brown Co.

It was hovering at 4 1/2 when I looked this afternoon. I actually,
<blush> picked up 5K shares when I saw the IBM announcement come
over the tape. At that time, I think it was still in the 2 1/2 - 3/4
range. :-) A pact with Big Blue was the kind of credibility
boost that a company in Atari's shape needed.

There seem to have been over 1.4 million shares traded today.
When was the last time THAT happened?

Cheers,

Chris

1229. Assembly '93 Atari party cancelled

Newsgroup: comp.sys.atari.st
Date: 1993-06-30 21:20:12 UTC
From: kkallio@vipunen.hut.fi
Message-ID: <kkallio.741475212@vipunen.hut.fi>
Source record: 203906

Assembly '93 Atari party has not been (luckily) advertised here, but I
decided to upload this because it has to reach as many demo-freaks as
possible.

STOP PRESS!

ASSEMBLY '93 ATARI PARTY CANCELLED!

Aggression apologizes for this fact, which is partly our own fault.

After we had been INVITED to organize the Atari compos and invitations,
we had a little problems with The Movement (one of the Amiga organizers),
mainly for some misunderstandings. We were THROWN OUT... for a while, but
after that we THREATENED to use our power and relations in our hometown
(where the party will be held) to cancel whole party. We could do this,
but we won't.

After a couple of hours we were INVITED AGAIN. That was OK. Our relation-
ship with The Movement has got better and better. But then four weeks later
we heard that only ACCESSION (Another Amiga group from the same town) had
their names in the official agreements for the partyplace. This was the
mistake:

NOBODY ELSE HAD MADE THE AGREEMENT FOR THE PARTYPLACE!

The reason for this was the fact that The Movement wanted that Accession
will be financially responsible for broken places, since they are well-
known partyplace destroyers. So, if someone breaks anything, Accession
will pay for it.

Then Accession said they won't allow Atari-competitions, because they were
afraid of quarreling between Amiga and Atari users. They KICKED us away
again. We explained that we had already sent invitations and so on, and we
can't cancel everything. OK, they said, we will allow Atari users to enter,
but there will not be any competitions for them. Ha! Try to find a better
excuse, we said. They seemed to think that Atarists will cause trouble only
if there will be competitions for them. Then they explained that there won't
be enough room for so many persons. If they will let the Atarists enter,
that is at least as poor excuse as the first one. Finally they said the reason
was that we had threatened them earlier. Ok, we had, but that situation was
caused by a misunderstanding between Meegosh (The Movement) and us, and it
was agreed and we had good relations with The Movement. Accession had not
told the REAL reason... They were after MONEY. They waited until we had
invited Atarists and then... Good Bye! Luckily our swapper was a little lazy
and he hadn't send all invitations.

Within one day, we got a new great place, but there wasn't any room at the same date. So we could arrange a party this year in Planet FunFun (indoor amusement park), which has room for over 3000 people to enter. The record of that place is far over 5000.

But the saga continues... MeeGosh of The Movement made some efforts for our RE-ENTERING. But in vain... Well, not quite. We were allowed to organize the competitions, but we would get only 25% of the Atari income for the competitions (Earlier we were promised to get 70%-75% of the Atari income), so we should get 140 Atari-dudes to get enough money for the graphics competition only. With this kind of agreement we needed about 400 Atari owners... This was said to be too much as there's only room for 1200 in total (The party will be a total failure, if there will be more). 20 classrooms and one hall of about 400 square meters is not enough.

Today 29th of June 1993 executive committee of Aggression had a following open election (as our official rules demand that.)

Question 1: Will Aggression organize the competitions in ASSEMBLY '93 with 25% of Atari income?
Question 2: Will Aggression try to deal with Accession for better profit?
Question 3: How about another party this year?

Q1: Q2: Q3:

Bast NO! NO! YES!
Jackdaw (In the army) - - -
Lancelot NO! NO! YES!
Owl NO! NO! YES!
Qwerty NO! NO! YES!
Teque NO! NO! YES!
WizTom (Not present) - - -
Xenit NO! WAR! YES!

The result is officially clear. Our rules demand a 3/4 majority in the elections...

Accession thought we were talking bullshit when we said they might have to search for a new place, but we could actually do that, but we won't, because our friends The Movement, Future Crew and Complex would lose their place too.

This will be Accessions last major party in Finland. Some of the members like MOKU, PEHU AND LENNU from ACCESSION have a ban of a lifetime in the Finnish parties organised by us or our allies.

Sorry this all happened... But we will arrange another party later this year anyway. If our current plans don't crash, the place will be Planet FunFun at Kerava and the promised Falcon030 will be the main prize in the demo competition.

Yours, Chairperson Jan Achrenius
Vice chairperson Kiia Kallio
Secretary Tero Kostermaa

Treasurer Jussi Haapiainen

Tomi Kivel{
Kata Liukko
Saku Lehtinen
Jari Vuorenp{{

P.S. If you (Atari user) still think that you will attend ASSEMBLY '93,
you might be able to do that, but there are no compos and ACCESSION
takes all your money... So BOYCOTT it if you still can.
We aren't able to guarantee your security.

Most likely there will be another party this year, and this time
we will not send the invitations before we have signed an official
agreement with the partyplace.

I hope we made everything clear to you and if you still have
something you would like to ask please make a voice call to:

>Atari 68000 and 68030/68882 version of POV-Ray.
>
>They still haven't said yes or no.

I got some e-mail from Drew Wells who said, basically, that the POV-Team would prefer that version 1.0 not be released due to problems they've had with ports not working correctly, and also due to the fact that they will be releasing 2.0 soon. They are changing their policy with the release of version 2.0.

For this reason, the recently uploaded binaries for POV 1.0 ST were not released on atari.archive.umich.edu. If you have GNU C, you can always compile the UNIX version for your own use (which is what the legal documentation says anyway).

Does the JPG decompression algorithm use any calculations that would be speeded up with the use of a math coprocessor? I know several people have mentioned that the Falcon's DSP would help, but what about the 68881/2 that are in TTs and some MegaSTes (now that I think about it, I think there were some expansion boards for the other STs too...)?

If so, could someone write a jpg decompression program that uses them (if present)?

1240. NVDI and graphics cards (especially Nova)?

Newsgroup: comp.sys.atari.st
Date: 1993-07-01 01:23:03 UTC
From: dud@stein.u.washington.edu
Message-ID: <20te9n$qau@news.u.washington.edu>
Source record: 203917

Anyone have experience with NVDI and graphics cards? I will soon buy a Nova graphics card, and I wish to purchase NVDI, but I don't want to waste my money on something that doesn't work. I've been in touch with the UK distributers of NVDI and they don't know if it will work. They said that they have a version made specifically for the Crazy Dots board, but have not tried it on other boards. Has anyone else?

Thanks for any insight...

Dan Aylward

I recently downloaded maggie11.zip from the atari.arc at umich.
The program works fine on my ST under TOS 1.04. I gave a copy to a
friend who owns a Mega STE running TOS 2.05. The program won't
run at all on his machine. Has anyone out there had any sucess
running this on Mega STE or falcon? It seems as if it ought to
run considering several of the articles concern the falcon. Also,
anyone have an E-mail address for the authors of maggie11 so I could
report this problem to them? Thanks.

1243. Re: IBM/Atari Jaguar deal

Newsgroup: comp.sys.atari.st
Date: 1993-07-01 02:28:01 UTC
From: saj@chinet.chinet.com
Message-ID: <C9Gs6q.23A@chinet.chinet.com>
Source record: 203923

One this Atari/IBM deal. Sounds to me like a good thing, but not something for anyone to get carried away about. Atari designs great machines. Not being psychic, I don't know what goes on inside there, but I've heard enough statements by people starting out enthusiastically. Somebody makes the right noises up front to get good people to generate good ideas. Then Atari's horrible manufacturing system drags everything into Hell. Computers, game machines, makes no difference. Atari dreams well, manufactures badly and doesn't market at all (If you don't have anything to sell, it doesn't matter how you don't sell it).

IBM is fresh out of dreams lately. They manufacture stuff well; they do QA well. If Atari, given bunches of product, turns out to be able to sell it, this could be a big deal. But as Hutch pointed out, there isn't much prospect of Atari making serious money selling Jaguar consoles.

I'd guess that if this arrangement works out, Atari will try to get IBM to manufacture computers for them too. While the Atari name says games, Jack Tramiel seems to enjoy being in the computer business. And what the chairman likes.....

Given availability of the units, something very Falcon-like could be a mass market item, if only as a cheap photo-CD viewer.

IBM can use anything they can get to avoid closing factories while they search for a new vision (and I don't worry about IBM in the long run).
Steve

1244. $4.12 and continuing to go up???! Atari Stock

Newsgroup: comp.sys.atari.st
Date: 1993-07-01 02:50:18 UTC
From: aa399@cleveland.Freenet.Edu
Message-ID: <20tjda$cn2@usenet.INS.CWRU.Edu>
Source record: 203920

Atari's stock closed at $4.12 today.

It was the most active and the highest gainer. There were over 1 million shares traded on AMEX.

The stock hit $4.50 at one point in time before in came down.

It was the talk of the Business Report on PBS.

Also, USA Today placed in their "big tip-off" header of the Money section that the Jaguar will be released.

The Wall Street Journal and the New York Times BOTH had a write-up about the Jaguar and IBM manufacturing it.

Just think, if you were one of the few people that purchased Atari's stock at .50 a little over a month ago, you made yourself a bundle!

New shoes, new shoes, I got to get me some new shoes. :)

Yeah, but it's about as risky an investment as you could find. If
they'd passed the 10 to 1 reverse split, for example, you'd probably
now be holding a tenth as many worthless shares. (I've seen companies
destroy their stock by reverse splitting. The stock will soar for a
day and then settle back down to its original price, thereby quickly
decimating stock value. The Tramiels should thank their lucky starts
it was voted down.)

>ObCynicalComment: All those Atarians who have been using deragatory
>terms for IBM these past few years sure are singing a different tune
>now! :)

Well, IBM still sucks :-|, but they do have some good points. The major ones in this case being that they _can_ fill demand, and that they have better distribution. The nice thing about this deal is that it's still an Atari product.

It looks to me like this deal will be a very good upturn for Atari. Since they convinced someone to let 'em at half a gigabuck, I'm convinced that they're actually going to sell a lot of these things. (BTW, does anyone know where they got the captial? Either I missed it or it hasn't been mentioned yet...) And IBM shold be able to manufacture and distribute appropriate numbers.

Who knows, maybe Atari will go back to being a $2 billion a year company....
Well, no, they won't, but it's a nice thought.

Thanks for your time,
Steven Ourada

1252. MfsfM (Marcus' file selector for MiNT) Version 1.03

Newsgroup: comp.sys.atari.st
Date: 1993-07-01 10:26:05 UTC
From: haebler@uni-muenster.de
Message-ID: <20ue3t$15pj@obelix.uni-muenster.de>
Source record: 203929

Hi,

I have just uploaded the newest version of MfsfM to ftp.uni-muenster.de.
It should be there in a few hours. MfsfM is a file selector. It needs
MiNT and it supports long file names, links etc. The version you find
on the ftp server is a limited version. You can only have 50 files in a
directory. Sorry but I think that this is neccessary to make shure that
I get the shareware fee. The fee is 10DM. This should be not too much.

I hope that you like it. Test it.

Well thank you for all those that replied with ZOO help..

Well the version of ZOO that I am using is the one thats on tu-berlin
its the selfextracting ZOO2014 version, gather this is a better
version than the Bammi one..

I am running it from the Desk Top and from a Ram disk as I don't wish to suff
up my hard disk..

So far nothing works at all, it some times does give a error with a
ine of text, but its stating Drive that I am not using,
like D:/TC/------/C/number.??

Is it possible to ZOO files that are on a different drive, from were
ZOO.TTP is run from..

The reason for all of is a Archive converter, that is driven from a GEM
shell...

Its the only Archiver (ZOO) that does not work, all others do..

So how does one use it from the DeskTop..??

Roger..... sheppard_r@kosmos.wcc.govt.nz

Yes.
I am using ZOO version 2.1 from ftp.cs.ruu.nl (surprise, surprise).
My zoo.ttp is on drive C:. If I double click on it and give the command:
ah// foo.zoo a:
it will archive all files in all directories from drive A:

ah// foo.zoo a:\
ah// foo.zoo a:/
all work the same, no problems.

And
ah// foo.zoo a:/foobar
ah// foo.zoo a:\foobar
ah// foo.zoo a:/foobar/
ah// foo.zoo a:\foobar\
will all archive all files in directory A:/foobar.

BUT the drive number is NOT stored in the .zoo file. All paths in the .zoo
file are absolute paths starting with "/".

1262. Fortran Compiler for ST??

Newsgroup: comp.sys.atari.st
Date: 1993-07-01 14:55:27 UTC
From: marra@lamont.ldgo.columbia.edu
Message-ID: <1993Jul1.145527.5317@lamont.ldgo.columbia.edu>
Source record: 203940

Can anyone recommend a fortran compiler for the ST? I saw a reference to
a source called Absoft. Who are they?

Thanks, John

Look again. The stock closed at 4-1/8 Wednesday. Thank goodness that I picked
up a few shares at 2-7/8. I'm still kicking myself for missing out on the
FIFTY CENT per share price earlier this year. I had a feeling Atari had
something up its sleeve :-)

Atari was the big gainer on ther AMEX exchange yesterday, up 5/8 to 3.0.
It seems somebody thinks the deal with IBM is pretty good.

I expect that you are mixing up cause and effect. Companies don't do reverse splits unless they are in trouble. Companies that are in trouble often get in worse trouble.

When the price gets down to $0.50 per share it is impossible to have small movements in the price.

Well, contact any of the larger software houses in the UK and they should be able to help you. I know that the Gemulator is being sold over there, I'm just not sure exactly where. You could always buy one direct from the US supplier which is Purple Mountain Computers, 15600 NE 8th St., #A3-412, Bellevue, WA 98008, USA, phone (206)399-8700. I don't know if they have a fax. Better yet, contact the Gemulator Developer, Darek Mihocka, at darekm@microsoft.com and ask him who his UK distributor is. I'll bet he knows. :)

1272. MIDI-able samplers

Newsgroup: comp.sys.atari.st
Date: 1993-07-01 16:07:44 UTC
From: malcolm@minster.york.ac.uk
Message-ID: <741542864.15586@minster.york.ac.uk>
Source record: 203822

Hello all. I have two ST's, and am running Cubase on one of them to drive some synthesisers. I would like to run the second ST as a sampler, from MIDI, just as if it were another MIDI black box.

Obviously what I'm looking for will be a plug-in device to allow audio in and out, and software to store and manipulate samples, and play them back under MIDI control.

What is there on the market? I've seen names like Replay 8/16/Pro, NoiseTracker, and so on. Do these do what I want? What is sample quality like? What is the frequency response of the Audio->Digital converters like? How easy is the software to use? How do they compare with dedicated sampling computers like the industry-standard Akai S1000? Is the storage format (on floppies) compatible?

Info on your experiences would be appreciated.
Thanks,
-malc.

>day and then settle back down to its original price, thereby quickly
>decimating stock value. The Tramiels should thank their lucky starts
>it was voted down.)
>
>Dave Baggett

For one thing, the company changed its position the last minute and advised
all stockholders to vote against the reverse stock split.

Another thing to remember is that Jack Tramiel owns 48% of the stock so
really, other shareholders have no say so in what happens with the company.
The other 5% is held by the other Tramiels.

The fact that "shareholders did not approve" is really cute since it is
really ONE shareholder that did not approve--Jack.

What usually happens with stock is that an announcement is made such as
a 64-bit video game system. The stock shoots up by $3 or $4 (I expected
it to be $5 or $6 by now) and then after all the excitement is over
with, the stock goes down by a $1.00.

The stock will still be up there pretty high. Especially with Atari stock
because people think that Atari will reclaim their video game crown
with the 64-bit video game system with sales in the billions.
They of course have no hope of getting sales into the billions until late
94 or late 95.

And really, I thought it was kind of foolish to begin with that Atari would
even propose the reverse stock split. As soon as they announced the
Jaguar, you have to be crazy to think it wouldn't go up. A 64-bit video
game system????

Atari's stock has hit $5.00 today and it seems like it may be going higher. I guess we will have to see where it goes.

Well, at least I feel safe that if it hits ceiling is $5.00, it shouldn't go below $4 for at least a couple of months.

"Lightning Quick"
The Hard Drive Defragmenter/Optimizer

The DataBasement
35244 Chestnut St
Wayne, MI 48184

Features:

+ Written in assembly language its compact and fast!
+ Easy to use point and click GEM interface.
+ Follows Atari's Programming guidelines, even works on the Falcon.
+ Works with all hard drives.
+ Offers the most comprehensive data 'map' available for the Atari.
+ Interactive visual map allows manual operations on clusters such
as Tracing files, moving, reserve/free, and zeroing.
+ Offers condensed and expanded mapping modes.
+ Info option gives vital stats for each partition/disk including;
number of files/folders, percentage fragmented and more.
+ Works on floppies as well.
+ Option to optimize directories, giving unused space back to the
system.
+ Will quickly defragment your drives automatically!
+ Uses available memory making it one of the fastest Defraggers
on any computer system.

SHAREware at $20 + $3 shipping and handling its a steal!

SHAREware at $15 + $3 shipping and handling its a deal!

Timing Comparisons Between Blitzschnell 1.47 and Hard Disk Sentry 1.3;

Computer Memory Size	Partition Amount (Megs)	# Files & Used Folders	Blitzschnell's Time min:sec	Hard Disk Sentry Time min:sec
4 Megs	10.0	3.7 146	00:57	02:57
4 Megs	10.0	7.3 364	01:53	06:02
4 Megs	10.0	7.6 327	02:23	N.T
4 Megs	32.0	30.5 1298	08:12	33:10
1 Meg	8.3	8.3 391	02:18	N.T
1 Meg	32.0	30.5 1298	11:26	N.T
512 K	8.3	8.3 391	02:39	N.T

N.T = Not Tested.

As you can see Blitzschnell is clearly much faster! While none of the partitions were severly fragmented you can expect better than a ratio of 2 Megs/min. even on a machine with only 512K. Times may vary with drives seek and throughput rates. All testing was on a 30 ms / 650K MFM Supra 40 Megabyte Hard drive with no caching.

Do you blame them? Atari has absolutely no credibility at this point. That is exactly what they needed to make the jaguar thing fly. What better way to gain credibility than to sign a high profile manufacturing agreement with a deep pocketed multibillion dollar firm?

I didn't touch Atari's stock until I saw the announcement concerning Big Blue's involvement.

Cheers,

Chris

1285. Atari 1040ST system $400

Newsgroup: comp.sys.atari.st
Date: 1993-07-01 21:17:05 UTC
From: mg20+@andrew.cmu.edu
Message-ID: <IgApFFK00iUy8653Yz@andrew.cmu.edu>
Source record: 203812
Cross-posted to: comp.sys.atari.st,misc.forsale.computers,misc.forsale.computers.other

From: Michael Paul Greelish <mg20+@andrew.cmu.edu>
Subject: $400 computer system
Date: Fri, 25 Jun 1993 15:35:19 -0400

For sale, $400 with printer, $350 without, plus shipping (if any):

Atari 1040ST computer, with 13" color monitor, printer, mouse,
joysticks, and tons of software.
Very similar to an Amiga 1000. $470 cheaper than a student-discount Mac
Classic II, and it comes with a printer, COLOR monitor, and loads of
software.

Specs:

Motorola MC68000 processor @ 8MHz. Fast as a Mac Classic or SE, or a '286 PC.
Available adapter (Spectre GCR) to run Mac black and white software.

Built-in MIDI interface. Yup, had it right out of the box. Great for musicians.

1 Meg RAM, 192K ROM. TOS 1.0.

1 720K 3.5" floppy drive, IBM-compatible (you can read and write IBM
disks, which means that with the Apple File Exchange, DOS Mounter Disk,
or SoftPC, you can export data [i.e. word processing documents] to a
Mac. Hell, you can even export data to a REAL IBM-compatible with a 3.5"
drive.)

Atari color monitor. 640x400x16 colors, or 320x200x256 colors. Sound included.

Printer specs:

Epson LX-90 dot-matrix with tractor feed. 160 cps draft, 60 cps letter
quality. Boldface, italics, underline, graphics, foreign fonts, the
works. Comes with 1000 sheets tractor-feed paper.

Serious Software:

Word Writer 2.0. PC-compatible word processor. 85,000 word spell
checker, thesaurus, outliner, mail merge, etc.
DEGAS Elite. Way cool paint program.
Lots of utilities (disk fixers, file managers, anti-viral stuff, etc.)

Games:

Falcon 1.3 with add on disk-- Operation: Firefight. Just like the PC
Falcon. Full color 3-D.
Their Finest Hour-- Awesome Lucasfilm WWII air combat simulator.
Populous-- Just plain fun.

Breach 2-- A futuristic wargame where you control a squad of Space Marines. Much like "Aliens", only YOU control the Marines. Some serious enemy AI here. Comes with add-on mission disk.
Prime Time-- Parody of running a TV network.
Carrier Command-- An immense wargame. Command an aircraft carrier battle group against another carrier group. Can take WEEKS to finish.

Other Software:

Lots of 3-D graphics stuff. 2 years' back issues of STart, an Atari ST disk magazine.

Oh yeah:

2 joysticks, mouse, mouse pad, ALL documentation and cabling. Keyboard is built-in.

Reply via email to mg20@andrew.cmu.edu. Thank you.

Mike Greelish mg20@andrew.cmu.edu
No longer Carnegie Mellon University student. Now unemployed and looking for a job. Hope my account doesn't evaporate soon.
Spent 3 months off the net. Ahh, I can feel the juice in me again...

Absoft has a Fortran compiler out for the Mac; don't know
about the ST version. I have the compiler from Prospero,
which seems to mostly work, and has decent GEM bindings.

>
>I expect that you are mixing up cause and effect. Companies don't do reverse
>splits unless they are in trouble. Companies that are in trouble often get in
>worse trouble.

The point is that the split doesn't have the desired effect (which is to raise the price to a "reasonable" level by decimating the number of shares). Instead, the price goes up to a reasonable level for a short time, and then settles back down to what people have in mind is the "real" price, which in Atari's case would be a buck or two. This is over a matter of days, so the cause-effect relationship is clear.

I've only seen a reverse stock split once before, so I don't know if this scenario is typical. Having this anecdotal evidence alone makes me wary of a reverse split, though.

>When the price gets down to $0.50 per share it is impossible to have small
>movements in the price.

Percentage-wise, no.

BTW, Atari was up above $5 this afternoon (Thursday), which would make a pretty awesome return on a purchase at $.50 a share. I don't know what it closed at.

>go below $4 for at least a couple of months.

Wanna bet? :) I'll bet you the value of a share that it'll be below
$3 by next Friday. :)

This would have been a great wave to ride, but I think that it's over.
(For now.) Unless the Journal runs something on Atari's rally
tomorrow, I can't see how this kind of frenzy could continue. Big
traders are like lemmings...

Those who are looking to gamble might consider picking up some ATC when
it gets down to a buck or so, between now and the time the Jaguar
actually hits the stores. When it does hit the stores, (if it does so
without undue delay and QA difficulties) you can bet there will be
another big spike.

Totally true Chris, ATARI solved a couple of problems by getting
along with IBM:

*Jaguar vaporware label
*Quality assurance
*Distribution
*Mass-manufacturing

Before the IBM announcement, ATARI is just too well known for
vaporware type things. Kudos to them since they'll have substance
now. The biggest ATARI obstacles now will be:

*Software development- must be unique products that truly
take advantage of the Jaguar. You
could have typcial me-too products too
wich are ever popular, but you need
cool software to differentiate from the
Genesis and SNES markets.

*Marketting - one of ATARI's weakest points right now. But they
have a good chance if they develop a couple of
excellent software titiles and hype their
system as '64-bit power'.

Imagine:

"Sega claims they are the 16-bit leader in game technology.
Atari agrees. Today Atari presents their 64-bit game machine: Jaguar"

1296. MiNT, MINIX, GCC

Newsgroup: comp.sys.atari.st
Date: 1993-07-02 01:09:51 UTC
From: evanlang@sdf.lonestar.org
Message-ID: <C9IJ8G.17y@sdf.lonestar.org>
Source record: 203863
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I noticed a new version of GCC has been released 2.4.5 or something like that. The MiNT version is about half the size of the TOS version. Is the MiNT version missing something?? I mean, if I get the MiNT version will there be any reason for getting the TOS version? The reason I ask is that I can only get 1MB a day, and GCC for TOS is over 1MB, for MiNT it isn't.

Is the new MiNTLIB (binary) released? What's the full name and path at a.a.u.e.

Has anyone gotten MiNT1.04 to load XFS drivers?? I can't get to the desktop or even get the drivers to load with 1.04, but .95 works fine.

Has the new MINIX.XFS driver been released (binary). I compiled the source for the last one and it was SLOWER than the last one. In fact, someone said that MINIX filesystem was faster than TOS and I've found it to be MUCH slower. I have problems with some programs (compiled in GFA of course) and the MINIX filesystem, but not the RAM disk filesystem, and both are long filenames.

I was thinking of modifying the RAM filesystem to use the BLiTTER to do its memory copy functions, and maybe speed it up that way (make faster than the blazing it already is, much faster and more compatible than any other RAM Disk I've used). I wish I could make it fragment RAM less.

What are the rules on stack sizes for GCC that are 0 or negative?? What do those mean??

Has MultiTOS been released? I mean can I buy it from the local dealer (US). Also, someone told me that the falcon doesn't need GEM.SYS and MultiTOS would work just fine without it because the built-in GEM and GEM.SYS are identicle. Is this true? If so, then why load the GEM.SYS and waste over 200K?

Any help would be greatly appreciated. Ever notice that I do this about once every 2 weeks?? Oh well.

Oh, for anyone interested. GEMDOS and MS-DOS use th same function numbers. Weird huh? I just found that out.

1297. Re: Please recommend BACKUP software.

Welcome to comp.sys.atari.st
============================

This newsgroup is devoted to discussion about 16 and 32 bit Atari micros. At
present that includes the Atari 520ST, 1040ST, Mega ST, STe, STacy, Mega STe,
TT, and Falcon. There are also emulators for the Apple Macintosh and IBM
PC/XT/AT available.

Most of the people who read this newsgroup are technically oriented.
The newsgroup serves as a resource for Atari users ... feel free to
contribute to the discussions.

Associated newsgroups include:
```

comp.binaries.atari.st ! uuencoded binary programs
comp.sys.atari.st.tech ! technical programming/hardware topics
comp.sources.atari.st ! uuencoded/shar sources

:EMILY: ??.??.??
Hints from Emily Postnews
==========

(Thanks to John Henders (jhenders@jonh.wimsey.bc.ca) for this bit of _humor_.)

Emily Postnews Visits comp.sys.atari.st

(Due to popular demand, (well at least one persone asked anyways), Emily has taken time out of her busy schedule to answer a few commonly asked questions specific to c.s.a.st.)

Dear Emily.
Some Amiga user is raving on c.s.a.st about how wonderful
his computer is, and how awful mine is. What should I do?
signed My Computer is NOT a Toy.

Dear My Computer, etc,etc.
Many people's egos are so tied to their possessions, they
have to affirm their existance by raving about the superiority
of their machine to anyone who will listen. You should immediately
flame these people into cinders, using every rumour or misconception
you've ever heard about their brand of computer, as this will cause
lots of posts, and develop into a massive flame war, which is one
of the main reasons most people read c.s.a.st. If this didn't happen
every six months, everybody would unsubscibe to this newsgroups from
boredom.
Or, you could put comp.sys.amiga.advocacy in the Followup to:
line, and any article replying to yours would go to the newsgroup
designed for this discussion.
Or, if your newsreader supports it, you could build a KILL FILE,
which eliminates any post that has the word Amiga in it.

Kill files can be created in rn and trn by hitting the 'K' key.
This will make a kill file based on the article you were reading
at the time. Then control K will put that file in the editor for you
to play with. You use the same regexp commands here that are in rn.
For example. /[Ff]oo/h:j would search all headers of unread articles
for both Foo and foo, and junk them. Check the docs for your newsreader
for further details.

Dear Emily.
I like flame wars, and want to start one of my own, so my name
will be as famous as Richard Covert's.
Signed, Too much Time on My Hands.

Dear Too much time.
Sorry it took so long to reply, but Richard's in my kill file
and someone had to forward your post to me, or I'd never have seen it.

Flame wars are fun. They're the main reason people creted Usenet,
and should be encouraged at every opertunity.
Some of the most common tricks for starting flame wars are as
follows.
1: Post a note in another newsgroup telling all the users there that
they own a piece of junk, and if they had a half a brain, they'd have the
same computer you do, as it's obviously the best.
2: Toss a bit of slander against another computer in a totally
unrelated post. This guarantees a follow up, even if your original
post wasn't of any interest.
3: Create a signature file that has a put down of another computer
in it. This will get flame wars going in threads that have completely
unrelated Subject: lines, thus slipping through all but he most exacting
kill files.
I hope you find these tips handy in creating your next flame war.
And just remember, your computer MUST be the best, after all, it's yours.

:DEV: 93.06.11
How do I become a developer for the Atari ST?
==========

Contact Bill Rehbok, (408)745-2022

[UNITED STATES ONLY. IF YOU LIVE OUTSIDE THE UNITED STATES, CONTACT
YOUR COUNTRY'S ATARI HEADQUARTERS FOR MORE INFORMATION.]

Bill can explain the program to you, and send an information packet if you
desire.

Atari has gone to a 2-tier developer membership. The 'higher quality'
developer support goes to commercial developers, and costs $250. The
'no-hand-holding, no announcement of company future products, no access
to discounted hardware' goes to noncommercial developers, at an initial cost
of $125, plus $50 renewal fee each year.

Both tiers receive the ST/TT Developer Kit and all developers have to fill
in an application form and a non-disclosure agreement. Contact Bill for

more information.

Atari is now selling the developer's kit (or parts of it) seperately. No project-in-development or non-disclosure agreement is necessary.

:ERR: ??.??.??
What does TOS ERROR nn mean?
What do the bombs on my screen mean?
==========

The information below was written, in part, by Darryl May, and posted on GEnie in January (of ????) by John Townsend. The original also appeared in the June 1988 issue of _Current Notes_ (122 N. Johnson Rd., Sterling, VA 22170). It has since found its way to me, and is being posted to comp.sys.atari.st as a service to readers.

Alan Pratt wrote to tell me that the basic information may be correct, but that it cannot be dubbed "official" unless it originates, on paper, from Atari. This makes sense, as electronic communications are easily modified, even accidentally.

Roland Waldi provided information regarding the difference between TOS and GEM return codes which appears to be correct. The tables have been modified to reflect his information.

The following is an unofficial list of the errors that can appear while you are operating your ST computer.

Error description return code alert box #
==========
OK (no error).....0
Fundamental error.....-1
Drive not ready.....-2
Unknown command.....-3
CRC error.....-4
Bad request.....-5
Seek error.....-6
Unknown media.....-7
Sector not found.....-8
No paper.....-9
Write fault.....-10
Read fault.....-11
General error.....-12
Write protect.....-13
Media change.....-14
Unknown device.....-15
Bad sectors on format.....-16
Insert other disk.....-17
Invalid function number.....-32.....1
File not found.....-33.....2
Path not found.....-34.....3
No handles left.....-35.....4

```
Access denied..................-36.............5
Invalid handle.................-37.............6
Insufficient memory............-39.............8
Invalid memory block address...-40.............9
Invalid drive specified........-46............15

No more files..................-49............18
Range error....................-64............33
Internal error.................-65............34
Invalid program load format....-66............35

The last code is the infamous "TOS error 35"!

Also, some unofficial information via Alan Pratt:

Notably, you should add -48: ENSAME (not the same drive, occurs when
you call Frename and the two names you give aren't on the same drive),
and -67: EGSBF: you can't use Mshrink to GROW a block of memory.

Those bombs that appear on your screen are error messages from
the 68000 micro-processor.

Number
Description of bombs
=========================================

What is Free-Net and how can I get access?
==========

A "Remodeled" Atari S.I.G. Opens

By now many of you have heard of the Cleveland Freenet, or more specifically the Atari S.I.G. on the Cleveland Freenet. For those who haven't, the Cleveland Freenet is an experimental computer system providing free public community telecomputing. Basically, it's a lot like a public library of the future. Many of these systems are popping up all over the country. Don't be surprised if one pops up in your neighborhood in the future.

Recently the Atari SIG has undergone a significant face-lift. All the regular areas are intact including its news sections, user group newsletter, online magazine sections, general as well as specific computer discussion boards (8 bit, 16/32 bit, Lynx, Portfolio), and our weekly Sunday night multi-chat conference.

The conference starts at 8pm EST sharp and is on channel "+Ataricon". What the staff at the Atari SIG has added, has given the Atari SIG the potential to cover all grounds of Atari and its related products.

The most noticeable addition to the Atari SIG is the Programming and Development Forum. This forum is intended to be used by developers, professional programmers, and Atari hackers (the old definition of "hacker") as a means to share ideas, help each other out, and find out the latest technical information on Atari's products. This board is ran by newly acquired SIG Operator, Peter Haller, a professional programmer who is running developer sections on hardware and software development, programming, MIDI applications development, Graphics Design, plus many other sections that can definitely become a programmer and developer's dream come true!

Last, but definitely not least, the Atari SIG has a restructured Product Info and Support Board and a new Special Applications Board. The Support Board includes a vast library of support lists. These lists range anywhere from phone numbers of Atari dealers and producers, to software reviews for 8 bit, 16/32 bit, Lynx, and Portfolio software. To sum it all up this area covers what's out there, who makes it, and how to get it for all Atari products. The Special Applications Board is just starting out. Currently there is an area for users of MIDI on the ST. MIDI users are encouraged to use this as a means to discuss MIDI related topics. This section is expected to expand in the future.

Accessing the Atari SIG has never been easier. One can access it via Internet by telenet'ing to 129.22.8.75 or "Freenet-in-b.cwru.edu" or by calling (216) 368-3888 300/1200/2400 bps. Once on the system, a user can apply for an account application and logon as a visitor. Once here, simply type "Go Atari" to get to the Atari SIG. A visitor can go anywhere on the Freenet and can read anything. They can't

post messages until they get their permanent accounts, however.

For additional information on obtaining access to Freenet write to
myself via the e-mail addresses above or by writing the SIG at its US
mail address:
The Atari SIG
P.O. Box 21815
Cleveland, OH 44121 USA

Lastly, a freenet application is available in the mail by writing a
request to the above address if you rather not download it from Freenet.

The Atari SIG is ready to serve the thousands of Atarians throughout
the world. We look forward to seeing you all real soon! Remember the
staff of the Atari SIG are volunteering their time for no pay and the
Cleveland Freenet, as well as the Atari S.I.G., is a non-profit organization
existing for the free exchange of information.

What magazines are available for the Atari ST?
==========

If you've got updates, mini-reviews,
or more information on other magazines, please send them to me via e-mail.

As always, WRITE to a company before sending them money for a subscription.

US mags:

AtariUser, published by Quill Publishing Company

Cover Price: US $1.00 Canada $1.45 UK 1.50 (AtariUser is available for free
[$6.00/50 magazine shipping charge] from participating computer dealers,
bookstores & user groups!)

Subcription Rate: $21.30 US Bulkrate, $41.30 US First Class.
Address: AtariUser, 113 W. College Street, Covina, CA 91723 USA

Current Notes, published by Current Notes Inc.

Cover Price: US $3.95

Subscription Rate: $27.00/year (Atari clubs registered with Current Notes may
subscribe at $23.00/year) US, $35.00/year (Canadian club members at $31/year)
Canadian, Foreign rate $44/year.

Address: Current Notes Inc., 122 N. Johnson Rd., Sterling, VA 22170 USA

Atari Interface:

Write for a free sample copy of the Atari Interface magazine
(Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108)

AIM is soon to be available in Canada, Europe and Mexico, and should be in all local WaldenSoftware stores and many bookstores. If your "local" Atari dealer doesn't have it, he should be able to get it for you...

UK Mags:
(Thanks to Sam Marshall <samm@castle.edinburgh.ac.uk> and Kevin Busby <kevinb@syma.sussex.ac.uk> for some of the info here.)

ST Applications:
---

formerly the ST Club Newsletter, this is now the only non-games mag in the UK (although see ST World below). Approx. 4,500 copies per issue sold. News, reviews, interviews, tech tips, general forum, programmers' forum, PD catalogue. DTP'd on an ST. Retains a 'user-driven' feel. Recommended. The associated ST Club runs a PD distribution service and distributes a couple of commercial programs too (Fontkit Plus, UIS III, Molgraph, CRL Virus Killer, etc.).

12 issue Subscription now:
With Disk 6 Mags Without Disk Mags

UK: #26.50 #18.00
Europe (air) #30.50 #21.00
World (air) #38.50 #31.00

Address: ST Club, 2 Broadway, Nottingham, NG7 1PS, UK.

ST World:
---

formerly the leading UK non-games mag. Became a quarterly 'buyer's guide' in Autumn 90.

ST Format:
---

all-purpose 150-page monthly, mainly aimed at young people. Lively, but of uneven quality. Big leisure section, but other areas covered too. Includes cover disk - mix of games demos and (usually out of date) PD utilities. Probably the biggest-selling UK ST mag. Has had several public rows with Atari UK.

Future Publishing, Somerton, Somerset, TA11 6TB Tel. 0458 74011
Fax 0458 74378

Atari ST User:
---

like ST Format. Generally (amongst online users) thought
to be not quite as good.

ST Action:
---

games, games and more games. And games.

Atari ST Review:

Lots of info, more mature editorial style than Format, but not so
polished. 1 cover disk per issue.

Subscriptions: PO Box 500, Leicester, LE99 0AA. Tel: 0858 410510.

There are also, I think, some MIDI mags with strong ST content. I don't
have their names.

German Mags:

Atari PD Journal:

('Suspened' from publishing...)

Reviewed in the May '91 issue of Current Notes [from which I'm cribbing this
information, DP-Z]. Hardware and Software reviews, some commercial software
reviewed. Typical issue runs around 90 pages. Special "Katalog" section.

Subscription: DM 70 (normal mail), DM 100 (air mail). Prices may be for
domestic distribution -- write first!

Address: Heim Verlag, PD Abonnement, Heidleberger Landstrasse 194, 6100
Darmstadt 13 GERMANY

ST-Magazin (formerly 68000er):

(monthly) Typical issue: around 150 pages. Includes DTP-magazine CICERO.

Subscription: DM 77 (domestic distribution); foreign - write for information

Address: ST-Magazin, Bretonischer Ring 13, 8011 Grasbrunn, West Germany,
Phone: ++49 89 456 160

ST Computer:
---

11 issues/year, typical around 180 pages

Subscription: DM 80 (domestic), DM 100 (normal mail), DM 130 (air mail)

Address: Heim Verlag, Heidelberger Landstr. 194, D-6100 Darmstadt 13 GERMANY

French Mags:

ST Magazine

Monthly in French. Oriented towards developers, professional users. Comes
with a disk each month.
ST Magazine - 10, rue Hegesippe Moreau - 75018 Paris - France
(French Teletel users: 3615 Teletel access, code STMAG)

STart Micro

Monthly, includes a cover disk. 11 issues per year. 64 + 16 (separated) pages.
Price: FF38 per issue, subscription: FF360. Subjects: Desktop publishing,
graphics, initiations to C and GFA Basic, survey of outcoming software, music,
folders. Minitel access: 3615 code ATARI. Address: FC Press, 57 rue Danton,
92300 Levallois-Perret, France.

Dutch Mags

ST, published by Stichting ST , postbus 11129 2301 EC Leiden the Netherlands
---
cover price: fl 6,95
Independent magazine by and for atari ST users.
covers all different topics from applications to games and hardware.
60 pages.

6 times a year. One year subscription fl 35,-
black and white pages.

Atacom, by Atari Club Groningen.

Never seen this one. I suppose you have to be a member of the club or so.
price is fl 4,95.
Adress of the club: Atari Club Groningen, Postbus 9164
9703 LD Groningen, the Netherlands.

Atari Nieuws, by Atari ST computer club Nederland

News paper sized publication. Lots of colour on newspaper pages. Not too many
pages though.
price is fl 3,95 (cheap cheap)
monthly publication.
adress: ACN, Postbus 5011, 2000 CA Haarlem, the Netherlands.

GFA-info, by GFA gg (usergroup)

Publication of the GFA-basic usergroup. This group has a lot of mainly
educational software available.
price is fl 5,00

adress: GFA gg, Frankrijklaan 14, 2034 BA Haarlem, the Netherlands

ST News, by Stichting Computers Eindhoven

This is an electronic magazine. It has been around for about 6 years now
and is completely in English!!! The first issues were in Wordplus format

back in 1986 but from the 6th issue on it included a readerprogram
both for color and monochrome. Even with music.
price is fl 10,00
adress: S.C.E., Kornoeljelaan 22, 5552 RC Valkenswaard

Swiss mags:

Atari ST News Schweiz

Dutch Atari ST Nieuws translated into German for the Swiss :-)

:TIPS: 93.06.11
TIPS AND HINTS from other users
==========

Any 'multisync' monitor which handles 70 video fields a second can be used
with the ST; the custom cable involves no tricks, or commercial ones are
available. The original NEC multisync does NOT handle 70 fields a sec.

More than 3 bombs often means more than 1 error, so interpretations are
tricky.

An ST-formatted disk which is not readable by a PC can be made readable by
putting the 3 bytes EB 34 90 (those were 3 bytes of hex) at the beginning
of the boot sector (sector 1 of track 0). This can be done with
either an ST or PC absolute sector editor. The Desktop of TOS 1.4 and
higher does this automatically.

Some (older) PC-3.5"-drives cannot deal with the short track-header produced
by ST formatters. On those drives, ST-formatted disks are not readable,
independent of their boot sector contents. The other way, however, does
always work: format on the PC.

When using disks formatted on a PC in an ST, make sure to insert and access
a disk with a different serial number in between disk changes.

For those with the 'inaccessible' mouse and joystick ports, a joystick
extender cable will make life easier. The Y-cable joystick extenders make
it extremely easy to keep mouse and joystick connected to port 0, and a
joystick extender cable in port 1 makes for easy hookup after you've moved
the machine.

BARREL is a program which can redirect printer-data to a file. It comes in
handy when your printer is unavailable, and the program does not already
have an option to 'print-to-a-file'. (It is available on the atari.archive
server.)

DBLEFEAT is a program which can redirect disk access from, say, drive A to
drive B. Handy when a program 'hard-codes' the data drive, and you
wish to use your hard drive instead. (It is available on the atari.archive
server.)

On the Desktop, holding the right mouse button allows
you to manipulate files in other windows. This is useful for a number

of reasons. An example is this: say D:\BLAH.ARC is a file you would like to extract to D:\, but ARC.TTP is on C:\. Top D:\'s window, then hold the right button while double-clicking ARC.TTP in an inactive window.

:ZNET: ??.??.??
Where can I get copies of ZNET?
==========

ZNET is now Atari Explorer Online. Please see EXPLOR for more info.

:EXPLOR: ??.??.??
Where can I get copies of Atari Explorer Online?
==========
Atari Explorer Online magazine is available on CompuServe and GEnie. You can also get copies mailed to you by sending an e-mail message to

stzmagazine-request@virginia.edu

indicating you wish to subscribe.

They won't get to you on Friday (which is when they're posted), but Greg Lindahl provides an excellent service to the networking community by sending these out.

Atari Explorer Online and some information from the Current Notes user magazine are also available from the atari.archive server under /atari/magazines.

:PD: 93.06.11
Where can I get Public Domain/Shareware software?
==========

There are FTP sources and a comp.sources.atari.st/comp.binaries.atari.st mail server. You can also try the commercial on-line services such as GEnie, CompuServe, Delphi and Bix.

Using FTP, most files should be retrieved in BINARY format (at least those ending with the suffix of .ZIP, .ARC, .LZH, .ZOO, .PRG, .TTP, .TOS)

Mail servers encode files. You will need a program called 'uudecode' in order to change files ending with the suffix .UUE (or .UAB, .UAC, etc.) into their original form.

:MAIL: ??.??.??
E-Mail file servers

archive-server@spud.hyperion.com:

Spud holds all of the comp.sources.atari.st / comp.binaries.atari.st postings. If you aren't reading these two newsgroups, you should consider doing so. You may obtain uuencoded files as e-mail. You can obtain a help file by mailing a message to archive-server@spud.hyperion.com, with the main body of the message being the word 'help'.

atari@atari.archive.umich.edu:

The atari.archive server is mentioned many times in this article. It contains a multitude of Atari ST PD and shareware programs. If you don't have access via FTP you can obtain many of the files via e-mail. You should first obtain a help file by mailing a message to atari@atari.archive.umich.edu, with the main body of the message being the word 'help.'. If you are from a uucp site, please enclose this statement also 'path host1!host2!....', where host1!host2!... is your path. Please read the help file completely before you ask questions, and then send any you may have to jon@atari.archive.umich.edu. Any questions about the archive or specific files go to weiner@atari.archive.umich.edu (or weiner@terminator.rs.itd.umich.edu, jeff.weiner@um.cc.umich.edu, weiner@zircon.labmed.umn.edu, or weiner@umnstat.stat.umn.edu :-)

archive-server@micros.hensa.uk.ac:

This is a UK public domain archive, available to sites within the UK via via JANET.

info-server@Germany.EU.net:

This is a german public domain archive. This only has comp.binaries.atari.st and comp.sources.atari.st.

archive-server@Germany.EU.net:

Same place as above, but this one carries other software than just comp.binaries.atari.st and comp.sources.atari.st.

mail-server@cs.ruu.nl (or uunet!mcsun!hp4nl!ruuinf!mail-server):
---
send the following message

begin
path john@highbrow.edu (PLEASE SUBSTITUTE *YOUR* ADDRESS)
send ATARI-ST/index
end

NOTE: *** PLEASE USE VALID INTERNET ADDRESSES IF POSSIBLE. DO NOT USE ADDRESSES WITH ! and @ MIXED !!!! BITNETTERS USE USER@HOST.BITNET ***

The path command can be deleted if we receive a valid from address in your message. If this is the first time you use our mail server, we suggest you first issue the request:
send HELP

LISTSERV@UOGUELPH.BITNET:

Mail messages with the contents HELP will bring you some usage information and GET PROG-A16 FILELIST will provide you with a list of files. Subscriptions to INFO-A16 are also available on this server. INFO-A16 is a digest of messages from comp.sys.atari.st.

:FTP: 93.05.05
Anonymous FTP servers

Note: The generally accepted practice for FTP use is as follows:

1. Limit access times to non-working hours. This is usually 6-8 pm to 8-9 am LOCAL time. LOCAL time means local to the computer you are accessing! For example, 4 P.M. in Minneapolis, Minnesota is 10 P.M. in England, and 10 A.M. in Germany is 4 A.M. in New York.

2. Once you connect, issue the following commands at your FTP prompt:

user anonymous
<YOUR e-mail address should be entered at the Password: prompt)
ls
cd <to the appropriate directory>

3. Limit downloads, especially across the ocean. Remember, there are other people who are using the same lines as you.

Atari FTP sites (the list is -not- exhaustive)
---

atari.archive.umich.edu [141.211.164.8]

uk.ac.lancs.pdsoft (available to UK users via JANET)

Note: Access is a bit different for this archive site, use the following:

user pdsoft
pdsoft (at the Password prompt)

ftp.Germany.EU.net [192.76.144.75]

ftp.cs.ruu.nl [131.211.80.17]

src.doc.ic.ac.uk

This site has a mirror of atari.archive.umich.edu in /computing/systems/atari/umich.

:COMP: 93.03.01
Atari-related companies
==========

This is a (still under construction) list of companies and addresses that might be of use to Atari ST users. Please send me addresses for the blank ones on this list. See also IAAD, it lists many more companies that are not on this list.

Welcome to comp.sys.atari.st! Please read this FAQ before posting a question
to comp.sys.atari.st, since a lot of common questions are answered here.

Thanks to David Paschall-Zimbel (davidli@simvax.labmed.umn.edu) for
compiling most of this FAQ.

Entries are dated by the last change. ??.??.?? means they were last changed
before the dates were added.

The following is an index of the questions answered in this part of the FAQ.
For easy access to a particular question, search for the tag surrounded by
colons (i. e. :GNU:). Questions marked with '*' are new or changed.

Welcome to comp.sys.atari.st
==========

This newsgroup is devoted to discussion about 16 and 32 bit Atari micros. At
present that includes the Atari 520ST, 1040ST, Mega ST, STe, STacy, Mega STe,
TT, and Falcon. There are also emulators for the Apple Macintosh and IBM
PC/XT/AT available.

Most of the people who read this newsgroup are technically oriented.
The newsgroup serves as a resource for Atari users ... feel free to
contribute to the discussions.

Associated newsgroups include:

comp.binaries.atari.st ! uuencoded binary programs
comp.sys.atari.st.tech ! technical programming/hardware topics
comp.sources.atari.st ! uuencoded/shar sources

:ARCS: 93.06.11
How do I deal with Archived files (.ZOO, .ARC, .LZH)?
==========

Files ending with suffixes .ZOO, .ARC, .ZIP and .LZH are archive files. They are binary files which may contain one or more other files in a compressed format. Archive files usually take up less disk space, and for this reason have become quite popular for transferring large files via modem.

In order to extract the files from an archive file, one must use an archive program. Here are the correspondences:

ZIP Use UNZIP.TTP or STZIP.PRG
ARC Use ARC.TTP
LZH Use LHARC.TTP
ZOO Use ZOO.TTP

A few hints for first-time users:

* Most archivers will give a short summary of commands if invoked with no arguments.
* If in doubt, to extract a file, copy the archiver to the directory that the file is in, and run the archiver with the arguments 'x [filename]'.
* If you have TOS 1.4 or higher, and/or a CLI, you can avoid copying the archiver by just changing the current directory to where the file is. See TIPS for a tip on how to do this from the desktop on TOS 1.4 or higher.
* Read the documentation for the archivers you use, they will almost certainly answer all your questions. Documentation is usually included in both the source and binary distributions (such as zoo21bin.zoo).

ARCHIVERS
These programs are all available via FTP from the atari.archive server, in the /atari/archivers directory. Recommended files are:

arc602.ttp - version 6.02 of ARC, includes features to archive subdirectories and also include comments with files.

arc602.arc - contains documentation. UnArc using arc602.ttp.

arc521e.arc - older version of ARC. Used mostly by those who want speed, better compression, and don't care about archiving subdirectories. UnArc using arc602.ttp.

lharc.ttp - version 2.0 of LHARC.

lzh201i.lzh - Thomas Questors lzh utility. German documentation. UnArc using lharc.ttp

stzip22.lzh - STZip, with GUI interface

unzip41.lzh - Old version of unzip

zoo21.ttp - version 2.1 of ZOO

zoo21bin.zoo - ZOO archive includes documentation. UnArc using
zoo21.ttp.

:MSA: 93.06.11
Some info on Magic Shadow Archiver
==========
(This was provided by Chris Herborth)

MSA Archives

The Magic Shadow Archiver (MSA) is a disk archiving program that allows an entire disk to be compressed into one file for transmission. The Magic Shadow Archiver (in shadow.[arc?|lzh?|zoo?] on atari.archive.umich.edu in ~/Archivers) creates .MSA files, which are often compressed using a normal archiver, such as zoo or lharc.

Magic Shadow is notoriously bad when used on a 1/2 meg ST and only one floppy drive. Its disk access and memory use are very badly thought out, and could result in over 160 disk swaps when unpacking an 80 track, double-sided disk.

Due to the fact that it was the _only_ disk image archiver around for quite a long time, Magic Shadow is the de-facto standard for creating disk images of computer demos and other pieces of software that cannot be easily compressed as files.

Because MSA files are disk images, they can only be used to recreate a floppy disk. There is (currently, see below) no way to extract the files from an MSA archive without writing it to a floppy disk.

Magic Shadow works perfectly with any legal TOS floppy format, even high density disks found in modified STs and most MegaSTes and TTs.

Chris Herborth (herborth@pinot.waterloo.ncr.com at work,
cherborth@semprini.tdkcs.waterloo.on.ca at home,
C.HERBORTH on GEnie) is writing a much more efficient MSA extractor, called UnMSA. UnMSA will minimize the number of disk swaps, and speed decompression considerably.

Daryl Richards (no email address, yet) is working on an MSA-Mounter, which will allow someone to unpack an MSA archive to RAM or a file on a hard disk. This uncompressed disk image will then be added to the system as a logical drive (much the same way a RAMdisk adds a drive to the system). MountImage on the Mac is an example of the way MSA-Mounter will eventually work (MountImage is so good, you can install new versions of the Mac OS using floppy disk images stored on your hard drive).

There is yet another MSA archiver now, called MSA II, by Phillip Lang.

:CLI: ??.??.??
What Command Line Interpreters are available?
==========

There are a large number of Command Line Interpreters for the Atari ST.
Some of the more popular ones include:

gulam the 'classic' cli, somewhat UNIX in flavor

BASH GNU Bourne Again Shell

ksh Korn Shell - available under MINT

gemini MUPFEL is the shell used by the gemini environment

master MS-DOS/Unix mixture, shareware.

okami a German shell with many useful utilities built in

pcommand an MS-DOS-like shell

csh C-shell, standard on Unix

tcsh Enchanced C-shell - available under MiNT

Check atari.archive under /atari/cli or /atari/mint, or check one of the
other FTP sites for files.

:ERR: ??.??.??
What does TOS ERROR nn mean?
What do the bombs on my screen mean?
==========

The information below was written, in part, by Darryl May, and posted on
GEnie in January (of ????) by John Townsend. The original also appeared in
the June 1988 issue of _Current Notes_ (122 N. Johnson Rd., Sterling, VA
22170). It has since found its way to me, and is being posted to
comp.sys.atari.st as a service to readers.

Alan Pratt wrote to tell me that the basic information may be correct, but
that it cannot be dubbed "official" unless it originates, on paper, from
Atari. This makes sense, as electronic communications are easily
modified, even accidentally.

Roland Waldi provided information regarding the difference between TOS and
GEM return codes which appears to be correct. The tables have been modified
to reflect his information.

The following is an unofficial list of the errors that can appear
while you are operating your ST computer.

Error description return code alert box #
==========
OK (no error).....0
Fundamental error.....-1
Drive not ready.....-2
Unknown command.....-3

```
CRC error.....................-4
Bad request...................-5
Seek error....................-6
Unknown media.................-7
Sector not found..............-8
No paper......................-9
Write fault..................-10
Read fault...................-11
General error................-12
Write protect................-13
Media change................-14
Unknown device..............-15
Bad sectors on format.......-16
Insert other disk............-17
Invalid function number.....-32.....1
File not found..............-33.....2
Path not found..............-34.....3
No handles left.............-35.....4
Access denied...............-36.....5
Invalid handle..............-37.....6
Insufficient memory.........-39.....8
Invalid memory block address...-40.....9
Invalid drive specified.....-46....15

No more files...............-49....18
Range error.................-64....33
Internal error..............-65....34
Invalid program load format....-66....35

The last code is the infamous "TOS error 35"!

Also, some unofficial information via Alan Pratt:

Notably, you should add -48: ENSAME (not the same drive, occurs when
you call Frename and the two names you give aren't on the same drive),
and -67: EGSBF: you can't use Mshrink to GROW a block of memory.

Those bombs that appear on your screen are error messages from
the 68000 micro-processor.

Number
Description of bombs

Trap Instruction Vectors.....32-47
[unassigned, reserved].......48-63
User Interrupt Vectors......64-255
```

:GDOS: 93.05.05
What is GDOS, and where can I get it?
==========

GDOS stands for Graphic Device Output System (at least that's what my copy of STart, volume 1 number 1 said...)

There is a newer version, called SpeedoGDOS, which should be available commercially from Atari. It is currently included with AtariWorks, and some Falcon packages. SpeedoGDOS uses scaleable fonts - you do not need to create a font file for every point size. There are desk accessories which allow you to manipulate available fonts, and also CPX programs for the newer Atari Control Panel. For those who only have limited memory, a newer version of GDOS is also included with the distribution. For those with investments in older bit-mapped GDOS fonts, they may be used with the new version of GDOS or used as bit-mapped (ie. non-scaleable) fonts within SpeedoGDOS.

You can get a copy of "Everything You Ever Wanted to Know About GDOS (and more)" by Douglas N. Wheeler from the atari.archive server. The file is /atari/programming/gdos.arc.

There is a German version of GDOS available from the atari.archive server. The file is /atari/utilities/amcgdos.arc.

Currently, there are no truly public domain sources for the GDOS system files or font files (at least those supplied by Atari). You can get these files with many commercial programs, such as Degas Elite, WordFlair, etc. You might also want to check your local user group to see if they received a copy of the WordFlair demo program (also available on GEnie). The demo program appears to have the GDOS system and font files.

In the UK The ST Club (2 Broadway, Nottingham, UK NG1 1PS. Tel 0602 410241, Fax 0602 241515) is a licensed GDOS distrubutor:

Catalogue No's:
GDOS-A Driver + Fonts 9-pin
GDOS-B Driver + Fonts 24-pin
GDOS-C Installed system for Opus (9 pin)
GDOS-D Opus 24-pin
GDOS-E FontGDOS + drivers
GDOS-F 300dpi printer fonts

Disks 2.95 pounds each.

:GNU: 93.06.11
What GNU software is available for the ST?
==========

The Free Software Foundation C compiler, commonly known as GNU C (or gcc) is avaiable for the Atari ST. The minimal memory required to do any useful (i.e. beyond 'hello world') programming is 2 megabytes. A 4 megabyte system is recommended.

There is an extensive archive of the latest GNU C programs via anonymous FTP on atari.archive. GNU C is also available at most European FTP sites. The latest version of GCC available for the ST is 2.4.2, this version includes built-in support for C++.

Note that most GNU documentation comes in TeXinfo format. Documentation in this format can be fed into TeX for printing. It can also be processed by Emacs' texinfo to make an info file, which can be viewed on-screen with Emacs' info mode. These two functions can also be performed by the standalone programs 'texinfo' and 'info' (on atari.archive as /atari/tex/tnxf241b.zoo).

The following can be found in the /atari/gnustuff/tos directory of atari.archive: (Note: all of these have Unixmode and MiNT support)

BASH Bourne-again shell
BISON Yet another YACC (Yet Another Compiler Compiler)
COMPRESS Compatible with Unix compress
DIFF Compares files; PATCH does the inverse
EMACS Extreme editor :-)
Fileutils Unix file utilities
FLEX Lexical analyzer, like Unix lex
GAWK AWK report generation language
GCC 2.4.2 C, C++ compiler
GDB GNU debugger, with source level C support
Ghostscript Postscript clone
GROFF Text formatting system
GREP Regular expression search, like Unix grep
MAKE Like Unix make
MAKEINFO Stand-alone system to process .info files
PATCH Changes files from diffs; DIFF does the inverse
PROF Profiles executable code
RCS Revision Control System

SED Stream editor
Smalltalk Smalltalk; object oriented language
TAR Tape archiver like Unix tar

:HAM: ??.??.??
Where can I find Ham Radio software for the ST?
==========

Plenty of Ham Radio software is available for the Atari ST:

Morse code
Radio Teletype (RTTY)
Packet Radio (W0RLI BBS and K9AQ TCP/IP)
Satellite Tracking
WEFAX
Color Slow Scan TV (SSTV)
etc.

For more information contact the Atari Microcomputer Network:

Newsletter Editor - Gil Frederick, VE4AG
130 Maureen Street
Winnipeg, Manitoba
R3K 1M2 Canada
or
Program Librarian - John Adams, KC5FW
17106 Happy Hollow
San Antonio, TX 78232
U.S.A.
or
Tune into the weekly net Sundays 16:00 UTC on 14.325 MHz.

73,
John Langner, WB2OSZ

:LANG: ??.??.??
Public Domain/Shareware languages...
==========

There are a large number of programming languages available for use with the
Atari ST. Programmers seem to flock to the Atari ST, and if you know of a
language, you can probably find it, or an equivalent, for the ST.

68000 assembler/disassembler
abc
APL
AWK
BASIC
C
C++
cross assemblers (z80, 6502, 68xx,8031/80xx)
Elan
FORTRAN

FORTH
FP
Hope
ICON
LISP
Little Smalltalk
Modula2
OPS5
perl
PROLOG
SCHEME
SIOD
Smalltalk
XLisp
XProlog
XScheme

Check the atari.archive server under /atari/languages. Most other archive sites will have a language directory which you can also check.

:MINIX: ??.??.??
Is MINIX available on the Atari ST?
==========

MINIX is a UNIX-like operating system for the IBM PC, XT, AT, 386, and PS/2, as well as the Apple Macintosh, Commodore Amiga, Atari ST, and later in 1991, Sun SPARC. It is available with all the source code for the entire operating system, the libraries, and nearly 200 UNIX-like utilities.

Demonstration disks for the IBM PC line and Atari ST are available for free via anonymous FTP for people on the Internet. A Macintosh version will be online soon. (If you can't wait, see below.)

To get a free demo disk and the manual, use ftp to connect to ftp.cs.vu.nl (192.31.231.42) and look in pub/minix/demo. The READ_ME file describes the contents of the directory and how to use it. Be sure to fetch and read this first. It contains important information.

If you don't have FTP access, you can buy the demo disk package from Prentice-Hall for $10 by calling (201) 767-5969 or FAX (201) 767-5625. Please DON'T ask me to send it by email. I have quite enough work already thank you. The ordering numbers for Prentice-Hall are:

- MINIX 1.5 IBM demo disk (0-13-582768-x) (in stock now)
- MINIX 1.5 Atari demo disk (0-13-582792-2) (in stock now)
- MINIX 1.5 Macintosh demo disk (0-13-582784-1) (in stock now)

Please note that although the demo disks are available for free on line, MINIX itself is copyrighted software and is not available on line. The demo disks are also copyrighted, but permission is hereby granted to upload and use them for evaluation purposes. The READ_ME file tells how MINIX can be ordered.

AS A COURTESY TO US, PLEASE DO NOT FTP DURING BUSINESS HOURS (EUROPEAN
TIME). PLEASE FTP AFTER 11 A.M. EASTERN STANDARD TIME.
If you want to follow the MINIX discussion, read the comp.os.minix
newsgroup, which is quite active and has almost 50,000 subscribers.

Have fun!

Andy Tanenbaum (ast@cs.vu.nl)

:MINT: ??.??.??
What is MiNT?
=============
MiNT is a free multitasking operating system extension for TOS. It is somewhat
like BSD Unix from the programmer's perspective. MiNT can run up to 1 GEM
program along with a lot of character-based programs simultaneously. MGR
and MW2 can both put multiple terminal windows on screen, and bgacc can
put a number of terminal windows on a GEM screen. MiNT and lots of stuff to go
with it can be found at atari.archive.umich.edu:/atari/mint.

TOSWIN is the new replacement for bgacc: it provides lots of nice features like
variable fonts, menus, selectable window gadgets, etc. GEMTERM is a similar
package (it's not part of the standard MiNT distribution) modelled after TOSWIN
and XTerm.

A somewhat interesting note: MiNT is now the kernel of Atari's multitasking
OS, MultiTOS. Originially MiNT stood for 'MiNT is Not TOS', but it's now
'MiNT is Now TOS'. :-)

:XWIN: 93.03.01
Is there a version of XWindows for the ST?
==

There actually is a port of XWindows to the ST now, although it is pricey.
Here's the (slightly hacked up) announcement for it:

X/TOS/window/server and X/TOS/window/server/color

Vendor:
X/software Michael Gehret
X/TOS division
Marktstrasse 8
W-8944 Groenenbach
Germany
TEL: +49 8334 1411
FAX: +49 8334 6245
email: xtosinfo@xsoft.uucp
CPU:
Atari Mega ST, STE, TT
68000 to 68040
Memory:
2 Mbytes (4 Mbytes recommended)
Operating System:
TOS 1.4 or higher
Mouse:

Atari mouse
Graphics:
X/TOS/window/server:
monochrome 640x400x1,
monochrome 1280x960x1 (TT, SM194)
X/TOS/window/server/color:
monochrome 640x400x1,
monochrome 1280x960x1 (TT, SM194)
color 320x200x4
color 640x200x2
color 640x480x4
color 320x480x8
Ethernet Card:
Atari Card (Mega or VME bus)
Riebl/Wacker (Mega or VME bus)
Biodata BioNet 100 II (DMA port or VME bus)
Network Software:
Atari/Riebl/Wacker ANS TCP/IP
Biodata TCP/IP
Disk Space:
none (two floppy disks, may load fonts from second disk or font server)
Features:
full X11 Release 5 implementation
Shape, Multi-Buffering, MIT-SUNDRY-NONSTANDARD extensions
PEX extension optional
support of font server protocol
support of X Display Manager Protocol
access control support
compatible to OSF/Motif and OpenLook
high performance (more than 32,000 Xstones on TT)
fast cursor tracking
backing store and save unders support
size of virtual screen limited by memory only, automatic panning
X/TOS/window/server/color supports all video modes at the same time,
including dynamic visuals
loadable key maps (xmodmap format), full support for European keyboard
layouts
3-button mouse emulation with Atari 2-button mouse
may run parallel to GEM (switching with hot key), configurable multi
tasking priorities
about 50 fonts supplied

:DEMOS: ??.??.??
Why won't demo x run on my machine?
==========

90% of the time, if a demo does not run on your American ST, you probably
need to be in 50Hz mode to use it. Get a program like 50hzboot.prg from
atari.archive to allow this.

:PAINT: ??.??.??
What is the format for [x] paint program data?
==========

There is a periodic posting of ST Picture Formats, edited by David Baggett.
The file is on the atari.archive server under /atari/graphics/picfmts.doc.

:PD: 93.06.11
Where can I get Public Domain/Shareware software?
==========

There are FTP sources and a comp.sources.atari.st/comp.binaries.atari.st
mail server. You can also try the commercial on-line services such as
GEnie, CompuServe, Delphi and Bix.

Using FTP, most files should be retrieved in BINARY format (at least those
ending with the suffix of .ZIP, .ARC, .LZH, .ZOO, .PRG, .TTP, .TOS)

Mail servers encode files. You will need a program called 'uudecode' in
order to change files ending with the suffix .UUE (or .UAB, .UAC, etc.)
into their original form.

:MAIL: ??.??.??
E-Mail file servers

archive-server@spud.hyperion.com:

Spud holds all of the comp.sources.atari.st / comp.binaries.atari.st
postings. If you aren't reading these two newsgroups, you should consider
doing so. You may obtain uuencoded files as e-mail. You can obtain a
help file by mailing a message to archive-server@spud.hyperion.com, with
the main body of the message being the word 'help'.

atari@atari.archive.umich.edu:

The atari.archive server is mentioned many times in this article. It contains
a multitude of Atari ST PD and shareware programs. If you don't have access
via FTP you can obtain many of the files via e-mail. You should first obtain a
help file by mailing a message to atari@atari.archive.umich.edu, with the main
body of the message being the word 'help.'. If you are from a uucp site,
please enclose this statement also 'path host1!host2!....', where
host1!host2!... is your path. Please read the help file completely before you
ask questions, and then send any you may have to jon@atari.archive.umich.edu.
Any questions about the archive or specific files go to
weiner@atari.archive.umich.edu (or weiner@terminator.rs.itd.umich.edu,
jeff.weiner@um.cc.umich.edu, weiner@zircon.labmed.umn.edu, or
weiner@umnstat.stat.umn.edu :-)

archive-server@micros.hensa.uk.ac:

This is a UK public domain archive, available to sites within the UK via
via JANET.

info-server@Germany.EU.net:

This is a german public domain archive. This only has comp.binaries.atari.st
and comp.sources.atari.st.

archive-server@Germany.EU.net:

Same place as above, but this one carries other software than just
comp.binaries.atari.st and comp.sources.atari.st.

mail-server@cs.ruu.nl (or uunet!mcsun!hp4nl!ruuinf!mail-server):
---
send the following message

```
begin
path john@highbrow.edu (PLEASE SUBSTITUTE *YOUR* ADDRESS)
send ATARI-ST/index
end
```

NOTE: *** PLEASE USE VALID INTERNET ADDRESSES IF POSSIBLE. DO NOT USE
ADDRESSES WITH ! and @ MIXED !!!! BITNETTERS USE USER@HOST.BITNET ***

The path command can be deleted if we receive a valid from address in your
message. If this is the first time you use our mail server, we suggest you
first issue the request:
send HELP

LISTSERV@UOGUELPH.BITNET:

Mail messages with the contents HELP will bring you some usage information
and GET PROG-A16 FILELIST will provide you with a list of files. Subscriptions
to INFO-A16 are also available on this server. INFO-A16 is a digest of
messages from comp.sys.atari.st.

:FTP: 93.05.05
Anonymous FTP servers

Note: The generally accepted practice for FTP use is as follows:

1. Limit access times to non-working hours. This is usually 6-8 pm
to 8-9 am LOCAL time. LOCAL time means local to the computer
you are accessing! For example, 4 P.M. in Minneapolis, Minnesota
is 10 P.M. in England, and 10 A.M. in Germany is 4 A.M. in New
York.

2. Once you connect, issue the following commands at your FTP
prompt:

```
user anonymous
<YOUR e-mail address should be entered at the Password: prompt)
ls
cd <to the appropriate directory>
```

3. Limit downloads, especially across the ocean. Remember, there are
other people who are using the same lines as you.

Atari FTP sites (the list is -not- exhaustive)
---

atari.archive.umich.edu [141.211.164.8]

uk.ac.lancs.pdsoft (available to UK users via JANET)

Note: Access is a bit different for this archive site, use the following:

user pdsoft
pdsoft (at the Password prompt)

ftp.Germany.EU.net [192.76.144.75]

ftp.cs.ruu.nl [131.211.80.17]

src.doc.ic.ac.uk

This site has a mirror of atari.archive.umich.edu in /computing/systems/
atari/umich.

:TEX: ??.??.??
Is TeX/LaTeX available on the Atari ST?
==========

The TeX/LaTeX typesetting programs are available on the Atari ST. Check the
atari.archive server under /atari/tex. Fonts and device drivers
(including one for the Epson 9-pin printers) are available on the
atari.archive server.

The latest version of TeX (3.14) has recently been made available on the
atari.archive server. The files are in a subdirectory of their own.

Graham Higgins recently wrote a message in comp.sys.atari.st indicating the
minimum files needed to get a working TeX/LaTeX system up and running on the
Atari ST. He said:

You'll need, at minimum:

The binaries for LaTeX/TeX :StTeXBin
The style files :StTeXSty
The font macros :StTeXTfm

If you want to screen-preview, you'll need screen font files (showdvi)
If you want to print locally, you'll need printer font files (dvifont)

Allow 5Mb.

For a step-by-step article on setting up Tex and LaTeX, send an e-mail request
to davidli@simvax.labmed.umn.edu. Be sure to mention 'tex.setup'.

There is also a complete, ready-to-install distribution called CS-TeX. The
latest version, 4.0, is available at atari.archive: /atari/tex/cs-tex-4.0.
This consists of 8 disks full of TeX stuff, plus an installation program

that takes care of the details for you.

==========
Hope you liked the comp.sys.atari.st FAQ. If you have comments,
suggestions, more material, etc., mail me at sourada@iastate.edu

Thanks to David Paschall-Zimbel (davidli@simvax.labmed.umn.edu) for
compiling most of this FAQ.

Welcome to comp.sys.atari.st
==========

This newsgroup is devoted to discussion about 16 and 32 bit Atari micros. At present that includes the Atari 520ST, 1040ST, Mega ST, STe, STacy, Mega STe, TT, and Falcon. There are also emulators for the Apple Macintosh and IBM PC/XT/AT available.

Most of the people who read this newsgroup are technically oriented. The newsgroup serves as a resource for Atari users ... feel free to contribute to the discussions.

Associated newsgroups include:

comp.binaries.atari.st ! uuencoded binary programs
comp.sys.atari.st.tech ! technical programming/hardware topics

comp.sources.atari.st ! uuencoded/shar sources

:MODELS: 93.01.30
All the models in the ST line
==========

This is a pretty complete list of all the ST/TT models and their main features. If you have any additions/correction, of course, send them to me.

Feature key:
CPU's:
8 8 MHz 68000
16 16 MHz 68000
16/3 16 MHz 68030
32/3 32 MHz 68030

RAM:
/1 128kB
/5 512kB
1 1MB
2 2MB
4 4MB
S SIMM slots for expansion

Built-in:
F Floppy
M TV modulator

Extra:
AV 8 bit digital stereo audio, 4096 colors, hardware scrolling, analog joystick ports
MB MegaBus processor-direct bus slots
6U 6U VME bus slots, second serial port
FC Motorola 56000 DSP, 16 bit stereo audio, much enhanced video

TOS:
Highest built-in TOS

Models:

Name	CPU	RAM	TOS	B.I.	Extra	Comment
130 ST	8	/1	1.0	M		Never marketed
260 ST	8	/5	1.0	M		
520 ST	8	/5	1.0	M		
520 ST+	8	1	1.0	M		
520 STm	8	/5	1.2	M		
520 STfm	8	/5	1.2	FM		
1040 ST	8	1	1.0	FM		
1040 STf	8	1	1.2	F		
1040 STm	8	1	1.2	M		
1040 STfm	8	1	1.2	FM		
Mega 1	8	1	1.2	F	MB	

Mega 2 8 2 1.2 F MB
Mega 4 8 4 1.2 F MB
STacy 8 1 ??? F Laptop
STBook 8 1 ??? F Notebook
520 STe 8 .5S 1.62 FM AV
1024 STe 8 1S 1.62 FM AV
Mega STe 16 1S 2.06 F AV,MB,6U
TT 16/030 Just for developers
TT 32/030 S 3.06 F AV,MB,6U Various mem/HD configs
Falcon 16/030 S 4.?? F AV,FC Many enhancements!

:FALCON: ??.??.??
What are the specs on the Falcon?
==========

Here's some stuff I culled from the (reposted) Delphi conference with Sam Tramiel.

--- Start Quoted material ---
Here's the specs on the Atari Falcon 030:

CPU: Motorola 68030 running at 16 Mhz
32-bit Bus
Optional 68881 or 68882 FPU
RAM: 1,4, or 14 megs
Standard Atari Cartridge Port
Motorola 56001 DSP chip

Expansion Bus:

Internal direct processor slot for 386SX PC emulation, or other coprocessor

Graphics:

Super VGA graphics: 640x480 with 256 colors
True color 16 bit mode allowing a display of up to 65,536 colors
Accepts external video sync signal to allow high quality genlocking
Overlay mode for easy video titling and special effects
Overscan on TV's and ST Color monitors
262,144 possible colors
hardware-assisted horizontal fine scrolling
BLiTTER graphics co-processor

Sound features:

Eight 16 bit audio DMA record and playback channels
Stereo 16 bit digital DMA input
Stereo 16 bit DMA audio output
SDMA sound/DMA Coprocessor

Standard Ports

SCSI II port with DMA
High speed LocalTalk compatible LAN
Connector for analog RGB color (ST or VGA) or composite video
RS232C serial port
Bidirectional parallel port
MIDI IN/MIDI OUT
Stereo microphone input, miniature stereo plug
Stereo audio out, miniature stereo plug
Two joystick connectors
Two enhanced digital/analog controller/light pen connectors

Data Storage

1.44 Mbyte floppy disk drive
Optional internal IDE Hard Disk

System software

Pre-emptive Multitasking with adaptive prioritzation (MultiTOS)
Inter process communication
NewDesk desktop and eXtensible control panel
Multiple window user interface; number of windows limited
only by memory or software in use.
--- End Quoted Material ---

:ACCEL: ??.??.??
Hardware Accelerators
=====================
(Thanks to Shoou-yu Tang sytang@lamar.colostate.edu for this info.)

68000 based: ICD adspeed ST/STe
Fast Tech Turbo T-16 (16MHz)
T-20 (20MHz)
T-25 (25MHz)
68030 based: Gadget by Small SST (16MHz to 40MHz user changeable, 8 SIMM slot
68882 FPU socket, 1 expansion slot, TOS 2.0x).
Fast Tech : Tiny Turbo
Full size version

:DRIVES: ??.??.??
What should I know about hard drives and the ST?
(Thanks to Shoou-yu Tang sytang@lamar.colostate.edu for this info.)

To get a hard drive for ST, STe, Mega, Mega STe or TT(using DMA port):
1. Host adapter (convert the ST's DMA to SCSI standard):
ICD, Supra, BMS are the three major manufature. ICD has very good
software updating support and updates very often.
2. SCSI hard drive or MFM/RLL drive with SCSI adapter:
i). SCSI drive:
Like Quantum Pro80LPS, Seagate ST-xxxN series, they have a 50 pins IDC
connector, and usually say SCSI hard drive or Mac drive. (Any Mac except
Mac128, Mac512, FatMac has SCSI built in, so a drive that works with Mac
usually has SCSI interface).
No other adapter needed, just connect to the host adapter in 1.

ii). MFM/RLL drive:
These types of drive is older and used in older IBM machines. To use
them you need an adapter to convert them to SCSI. Adaptec 4000/4000A
is for MFM, 4070 for RLL drive, Emulex and OMTI also has similar cards
availible. Adaptec has stopped production for quite sometime so look for
these in used/liquidation place. (usually goes $40 to $75 each).

Connect the drive to the adapter (said Adaptec 4000) then connect the
adapter to the host adapter. (said ICD). It looks like following:

```
-------------- ----------- ------------ ----------
| MFM drive |------->|ACB 4000 |------>| ICD |------>| ST DMA |
-------------- ----------- ------------ ----------
```

3. Case, power supply and cabels for the drive system:
Unless you have Mega, Mega STe, TT and the drive is 3.5" so you will put
the drive internally, you will need a case with power supply to house the
adapter and hard drive. IBM case is very easy to get and has a lot of space
for expansion.
For older drive you need about 40 watts each drive, for newer 3.5" drive
they use about 20 watts or less, Quantum LPS drive use about 10 watts each,
make sure your power supply has more than the drives need. Again if you
use IBM case, the 150 watts power supply for that type case can drive at
least 3 drives without problwm.
Cables: DMA cable usually comes with the host adapter.
power cable from power supply to drive usually comes with power sup
SCSI cable from host adapter to SCSI drive or adapter(for MFM/RLL),
it's 50pins IDC female connector on each end with 50 conductors
cable. Should be availible at place you get the drive.
For MFM/RLL drive you will need the usual MFM/RLL drive cable:
(a 34 conductors cable and a 20pins connector, again should be
available at the place you get the drive).

Now, connect them all together. Before power up, check the connection again.
And check the jumper setting on the drive (consult the drive's manual). If you
are using more than one drive with the system, make sure only the last drive
has the terminator (either a DIP or a signle inline package of resistor, which
usually is socketed and close to the SCSI connector on the drive circle board.
Remove the terminator from other drives. [only the last drive should have the
terminator]

Software usually comes with the host adapter, or you can FTP atari's AHDX5
from ftp sites.

:FLOPPY: ??.??.??
Can I use 1.44 meg floppy disks?

1.4 megabyte floppy drives will soon be available from Atari for MegaSTe
and TT machines. If you own an older Atari ST, there is a company which offers
a $199 kit (including floppy) to install and use the drive. (I will supply
the name next month, sorry...)

Note that Tos versions prior to 2.05 will not format a 1.4 meg floppy from the
desktop.

:GRAPHIC: ??.??.??
How can I enjoy enhanced graphics on my ST?

For stock STs, JRI makes a chip which allows a 4096 color palette.
There is also a public domain enhancement that allows 32768 colors on
older STs. This can be found as 32kcolor.lzh on some archives.

There are a number of graphics boards on the market. Here is a first pass
at listing some of them. The information is based on postings by Ben Gilbert
and Jari Lehto.

C32 board by Matrix Datensystem (Germany)
* 800x608, 256 colors
* all ST/TT models
* 256k, 512k and 1meg versions

C75Z board by Matrix Datensystem (Germany)
* 1024x768, 256 colors
* Mega ST or STe, TT VME Buss

(Matrix GmbH has over 15, maybe over 20 with all versions, different
graphics boards available, from hobbyist to professional, from CAD
to GenLock and digitizing.)

ISAC board by Dover Research Company (U.S.)
* 1024x768, 16 colors from palette of 4096
* makes hi-res look like ST low res, just with a huge window
* Mega ST buss
* Dover Research Co. (612) 492-3913

The Imagine by Wittich Computer GmbH (Germany)
* 1024x768, 256 colors
* Mega ST only

(Versions available for all ST/TT models. Several possible resolutions.
Reasonable price, but slow and not very compatible..)

Crazy Dots by TKR (Germany)
* 1024x768, 256 colors
* Mega ST only

(1280x800, 256 colors out of 16.7 million color palette. 1664x1200 for
both 16 color and monochrome. True color option available. Mega ST,
Mega STe and TT.)

reSOLUTION SuperVGA by GengTec (Germany)
* 8 resolutions, 320x200 through 1600x1200
* 16 colors without driver, 256 out of 256,000 with driver
* 1 mb RAM
* uses a standard VGA monitor
* Mega ST or regular ST
* available in U.S. from Rio Datel, 1-800-782-9110, (702) 454-700

(1024x768 is the highest resolution with 256 colors. Driver is called
Multicolor VGA option. Compatible with NVDI and Blitter. Multisync

monitor recommended.)

AlberTT
* like ISAC card, but specific for TT VME buss

MegaScreen
* 832x624 monochrome
* connects to MegaBus
* works with Spectre

Reflex
*1024x1024 with SM124 monitor
*2048x2048 possible with expansion
*usable with most big-screen displays

ODIN by Marvin AG (Switzerland)
* external expansion
* gives TT-resolutions to a regular ST

Cyrel
* RISC-based card
* extremely costly

Here's a few more cards, available from OverScan GbR, Saentisstrasse 166,
1000 Berlin 48, West Germany, ++49 30 721 94 66, ++49 30 721 56 92 (FAX),
++49 30 727 05 6 (Mailbox, language: German)

Autoswitch OverScan for the ST (NO STE compatibility) is DM 129.--, you
don't have to buy a new monitor. The maximum resolution on a SM 124
is variable, but in most cases at about 732*480.
AutoSwitch OverScan TT is a VME board. It's about 249.-- DM, you also can use
your old monitor, but it only works in the TTs five color modes
(3 ST-compatible modes, 2 TT-modes). Resolutions are variable, ask
OverScan about the values for your monitor.
Falcon ScreenBlaster blows up your Falcons resolution to a maximum of nearly
900*600 on SVGA-monitors. It'll be shipping as soon as Falcon030s
become available, and the pricing will be near 150.-- DM.

Graphics cards for which information is sought:

OmniChrome board by Omnimon Peripherals

JRI GenLock

Atari/Lexicor 24 bit color card

Jari Lehto proposed the following recommendations:

Low budget SVGA - reSOLUTION
Professional high-end use Cyrel (or is it Cyrix?)
Hobby or semi-pro DTP Reflex
Hobby DTP MegaScreen
To obtain TT resolution ODIN

:JOY: ??.??.??
What joysticks work best with the Atari ST?

The Atari ST works with joysticks with a 'standard' D-Socket. IBM-style joysticks, Apple joysticks, and Nintendo joysticks will -not- work.

Some recommended joysticks:

Konix Navigator - "best .. if you want to use it for any length of time"
Gravis - "responsive ... great for games like MidiMaze"
WICO - "strong reed switches, hard plastic and metal components"
Atari - "FAR more controllable and responsive than other, more durable units"

:MODEM: ??.??.??
What modems work with the Atari ST?

Any external modem should work fine with the Atari ST-series of computers. You will need to purchase or build an RS-232 cable. Be sure the cable is capable of establishing DTR with your modem, as many telecommunications packages check the status of the DTR line. (Ask your local hardware guru if you don't know what DTR is...)

The ST can connect to modems at up to 19,200 baud. Practically, you will purchase either a 2400-baud or 9600-baud modem. The cost of 2400-baud modems has dropped so much in the past few years that you should not even consider a slower modem. Believe me, modem speeds under 2400-baud are going to seem SLOOOOOOOW to you!

You will probably need a serial port patch program to use high speed modems on your ST; most versions of TOS have a bug in CTS/RTS handling.

:MONITOR: ??.??.??
What should I know about monitors and the ST?

The monitor is your connection to the ST. Without a monitor, you're typing blind. (Unless, of course, you have an RF modulator on your ST and attach it to your TV set. This is discouraged, as the bandwidth and resolution are pretty terrible for anything other than arcade games.)

There are three monitor choices for those of us owning Atari ST/STe equipment:

1. Monochrome monitors - these include the venerable SM124, one of the sharpest monochrome monitors on the market. Street price is about $150, used monitors should run around $80-90. You can also purchase a 19" monochrome monitor. This gives you a 'big screen' to play around in, and is best for work with DTP and CAD systems. The price is a bit high at $1500+, and you'll need a plug-in board, which is generally set up for the Mega ST machine.

2. Color monitors - including the SC1224 in all of its incarnations (JVC and Goldstar being the primary vendors). The newer monitor, the SC1435, has a 14" screen and stereo sound.

3. Multisync monitors - these monitors provide monochrome and color access in one monitor. The street price is around $450, about $100 more than a standard Atari color monitor. You need to reset your computer to change resolutions. In many cases, a nice little switch box is provided (or you can build one) which does this for you. Examples of multisync monitors include the OMNIMON RAINBOW MONITOR.

There are any number of monitor choices for those owning Atari TT equipment, although they all boil down to 'multisync VGA'. There 14" color VGA monitor from Atari is quite nice, as is the 19" monochrome monitor. Any standard 14" multisync VGA monitor will do as well. Forget moving your SM124 or SC1224 monitor to your new system, the cabling and electronics is just not going to work.

:PCEM: ??.??.??
How can I turn my Atari ST into a PC emulator?
==========
(Thanks to Shoou-yu Tang sytang@lamar.colostate.edu for this info.)

Supercharger is the only external PC emulator with 8MHz V30 and 1MB RAM in a nice lunch box. It connects to ST's DMA port and defaults as device 3. It's powered by external power supply. Has 8087 socket and one expansion slot. The 1MB RAM can be used as RAM drive by ST when the IBM side not used.

:SPECTRE: ??.??.??
How can I turn my Atari ST into a Macintosh emulator?
==========
(Thanks to Wayne (trek@ihlpb.att.com) for this info.)

Product: Spectre GCR from Gadgets by Small, Inc
40 W. Littleton Blvd
#210-211
Littleton, CO 80120
Retail: $299.95

Description:
The Spectre GCR is a combination of software and hardware that allows the Atari Mega/ST/STe/TT line of computers to emulate an Apple MacIntosh Plus(tm) Computer. The emulation is so good that most Apple software runs out of the package using your Atari Disk drives to read in the Mac software. It does all of this while running 20% faster than the program would on a MacIntosh Plus and provides you a 30% larger screen area.

The Spectre GCR is a combination of software (written by Gadgets by Small, Inc), a cartridge (also from Gadgets), and a pair of 128K Apple ROMs (from either a MAC 512kE(tm) or Mac Plus - part numbers 342-0341 and 342-0342 which you purchase separately from an Apple source.) The Apple ROMs can currently be purchased for around $150. MacIntosh documentation and software, including the operating system (referred to as System/Finder), are also required to round out the package.

The Spectre software is currently at release Version 3.0. Gadgets supplies fairly frequent updates to allow you to keep up with the Apple OS releases.

The Version 3.0 update retails for $20. Version 3.0 supports 15 of the 128K OS releases up to, but not yet including System 7 releases.

Spectre software supports Mac formatted disks (including formatting your own) with your Atari drives, Mac sound, large screen displays (1280x960) Mac harddisks via SCSI through a Megatalk board (retail $299.95 from Gadgets) or through an ACSI-SCSI host adapter (my Syquest works beautifully- and the excessive use of disk accesses in Mac software will have you wanting a hard drive). Spectre 3.0 also supports DOS Mounter and Apple File Exchange if you are needing MS-DOS data disks for Mac work. Language configuration support, keyboard support, A4 paper size support for Lasers have also been added to 3.0.

Running Spectre:
The feeling you will get when you see your Atari transformed into a MacIntosh with a decent screen is indescribable. The extra flexibility that you get will also make you feel more confident in the greatness of your Atari. You will also get to see some of the frustrations with one of the other sides of the fence - frustrations like excessive disk access, remembering not to remove/change a disk unless the OS tells you to, etc.

Speaking of changing disks, there are major differences in the operating philosophies of an ST and of a MacIntosh. You really must read the documentation that comes with the Spectre GCR (and I for one found that a real delight. Dave and Sandy have a very different approach to software documentation that makes it enjoyable reading.) You should also read the Mac Operating System docs. One other reference you may need if you are going to do much with Mac software is one of the reference manuals referred to as the MacIntosh Bible.

If you ask an Apple dealer if a particular piece of software runs on a GCR, don't figure you will get a straight answer. They won't know. The current compatibility list from Gadgets lists about 450 programs and their release numbers that have been tried and found to work with Spectre GCR. In general, if a piece of software won't work with the GCR, it is probably becuase of copy protection. Most serious Mac software is not copy protected.

One last note - earlier versions of the emulator exist that were not capable of reading Mac disks directly. It's a capability you will want.

(Thanks to Shoou-yu Tang (sytang@lamar.colostate.edu) for this info.)

Spectre GCR is the best availible, you need to obtain a set of 128KB ROM from Apple (they are used in Mac 512KE and Mac Plus, noted that Mac512 use older 64 KB ROM which is not good) to fully utilize the device. Also it's recommanded to use it with MONO monitor and at least 2MB RAM. The Spectre software takes about 300 some KB of memory, so on a 1040 there is not very much left for Mac, especially after the Mac system is loaded. 4MB memory and MONO is best.
It can read/write Mac disk direct using ST's drive (double side drive, as most Mac drive is double side). With DOS mounter or software like that you can read /write ST, IBM disk from the Mac desktop as well (don't try to run the ST, IBM

binary. It's only for file transfer). Or you can use Apple File Exchange to read/write ST, IBM disk.
Syatem 6.0.5 runs fine, system 6.0.6, 6.0.7 runs also. But system 7 will not run with it.

:UPGRADE: ??.??.??
Can/should I upgrade my ST?

The answer depends on the type of ST you currently have, and what you want to do in the future. Be aware that there are a large number of modifications one can perform on the venerable 1040ST, and that newer machines are coming down in cost so much that to obtain a certain feature it may be cheaper to purchase new than to upgrade.

1. Memory - most ST machines may be upgraded to 4 megabytes. The newer STe machines use either SIP or SIMM

2. TOS - for those still running TOS 1.0, now is the time to consider an upgrade. TOS 1.4 has been around for at least 2 years now, and is -much- faster (and safer) for those using hard drives. TOS 2.06 is available as a hardware upgrade to ST and MegaST machines for about $150 from CodeHead

>which seems to mostly work, and has decent GEM bindings.
>
Yes, Absoft did have a Fortran compiler for ST sometime ago, but I don't know if they are still support it or not. In fact I have a copy sitting right in front of me (original not copied), used it a few time and seems to be reasonable , the Prospero one has advantage of interface with other Prospero language which has C and Pascal for ST. I don't have any of Prospero one so can't comment on those. The Prospero also seems to drop out of US market, haven't seen their Ad for somtime now.

Tang

1302. Re: Atari up some more.

Newsgroup: comp.sys.atari.st
Date: 1993-07-02 07:05:40 UTC
From: rcarter@nyx.cs.du.edu
Message-ID: <1993Jul2.070540.8804@mnemosyne.cs.du.edu>
Source record: 203826

In article <1993Jul01.221558.27996@rchland.ibm.com>
ricardo@rchland.vnet.ibm.com (Ricardo Hernandez Muchado) writes:

> ... ATARI solved a couple of problems by getting along with IBM:
> *Jaguar vaporware label
> *Quality assurance
> *Distribution
^^^^^^^^^^^^
I don't know why everyone seems to zero in on this one; all this means is that IBM will be shipping it to stores; probably nothing more than this; Atari's past problems with distribution is because of the use of offshore factories; I doubt IBM will be -marketing- them for Atari...

> *Mass-manufacturing
^^^^^^^^^^^^^^^^^^
I would be curious to find out -exactly- how this deal came about; was the IBM factory (BTW, a state of the art place) sitting so idle, and IBM doing so poorly (at least stockwise) that they gave Atari some real sweetheart deal that they couldn't refuse? Something is -really- going on here...

> Before the IBM announcement, ATARI is just too well known for
>vaporware type things. Kudos to them since they'll have substance

I dunno; the whole stock thing is voodoo; Atari with IBM is almost like a blind rider on a lame horse; scary...

> The biggest ATARI obstacles now will be:
> *Software development- must be unique products that truly
> take advantage of the Jaguar.
> *Marketting - one of ATARI's weakest points right now.

Both points are absolutely true; finally, someone around here that understands marketing; if -I- were Jack T. I would cash in some stock, pay whatever it would take to get (let's say) 500,000 units of product (Jaguars) ready for delivery (let's say) Nov. 1, 1993; and spend a few bucks on a junket for the top dozen or so retail chain buyers in the US and sell the suckers THIS year.

Atari has -always- seemed to have troubles with marketing, and market timing; always too little too late to really compete...

> "Sega claims they are the 16-bit leader in game technology.
> Atari agrees.
> Today Atari presents their 64-bit game machine: Jaguar"

Man, I love it... "The CAT is here..."

Don't get me wrong; I am pure Atari through and through (one of the last 800s ever made; my 1040STF is serial number 84!); I am a two decade veteran of personal computers, and Atari (with some help) has always had what I consider to be the best environments, and bang for the buck.

But yeeesh... The doomsayers and the Atari Rulez people around here have got it all wrong; Atari is a (for all intents and purposes) is a privately controlled company; the stock prices don't mean anything; IBM will not really have a vested interest in whether Jaguar succeeds; the deal is -valued- at $500M over 3 years; that doesn't mean $500M will exchange hands; and yes, Atari makes good product, they just never have known how to market them; as long as Atari has a nice niche market for the computers (seemingly musicians and hobbyists) and for the game machines (which Jaguar -could- provide) Atari will be around.

Regards,

Your analysis that the desktop icons are contained in the desktop's object tree, and therefore not drawn in your tree, are correct. W_NEWDESK is not the solution you're looking for.

There are only 2 ways to accomplish this, that I can think of, and both are messy (maybe there are other ways that I can't think of?).

The first way would involve patching information into the desktop's object tree structure, either to change the BOX attributes or convert it to a G_PROGDEF for more flexibility. There are 2 problems: one is in locating the structure, the other is in modifying memory that you don't own under MultiTOS.

The other involves trapping the VDI area fill call, that you described in your article. This seems to me to be a "safer" approach.

I'm sorry I can't be more help. I believe a similar question was asked recently on GEnie, and the Atari response was "there's no legal way". Maybe Eric will jump in with better information.

********** STAR NX1000C Drivers... ************

Hi I have this Colour Printer A STAR NX1000C I think its also called by another name, (NL10C)..??

But I would like to find some Colour Drivers for it, for say 1stw+, Degas, and what ever..

This is not my Printer but I am trying to help some one that was sold this by a Bad Atari dealer, with out No Support at all, but that was some years back, it has never worked with the Atari al all...

Thanks....

Roger.............. sheppard_r@kosmos.wcc.govt.nz

1307. Off-topic Q: stock prices @ news/ftp?

Newsgroup: comp.sys.atari.st
Date: 1993-07-02 10:59:02 UTC
From: vogt@cipserv1.physik.uni-ulm.de
Message-ID: <vogt.71@cipserv1.physik.uni-ulm.de>
Source record: 203835

Greetings!

I know, this is a little off topic, but with all the mentions of Atari
stocks I'd ask just for curiosity:
Is there a newsgroup or a ftp-site that carries and updates market stocks in
more or less real-time?
I'd just love to see Atari stocks go up and up and bite my ass for not
jumping on that 1000%-profit-train when it was time to do...

P.S.: BTW, does anyone of you know, where the name "Atari" does come from
at all?
I know of "Hatari", which means in some African language "Danger, Warning!"
or something. Is it the same?

Ciao, Elmar

1309. IBM Production of Jaguar (Take #2)

Newsgroup: comp.sys.atari.st
Date: 1993-07-02 11:31:45 UTC
From: tony@hpqtdla.sqf.hp.com
Message-ID: <C9JC0y.DpE@hpqmoea.sqf.hp.com>
Source record: 203836

My first posting of this article goofed. My apologies. However, after some testing I think I've solved the problem.... On with the post :

Reading all this discussion about the Jaguar, I'm confident that Atari have finally got their hands on a winner. Over the last few years, poor quality control and production have done that a lot of harm.

I'm no great fan of the PC architecture decision IBM made all those years ago, but an area where IBM really excel is in their production. The automated equipment which they use in their own factories is sold to other companies, and is highly regarded.

One thing that is still impressive about the old 8-bit machines (I'm talking pre-XL/XE here) was their bulletproof build quality. Our old 800 will be ten years old in a couple of months, and it's never failed in any way. If the IBM assembled Jaguars are as well screwed together, Atari should be able to shake off the 'cheapo' tag.

My ST will be due for replacement soon, and I would have considered buying a Falcon had a shipped at the right time - and a better price. Now, however, I can buy myself a Mac or a Power PC (shipping in early '94) for the serious work, and buy a Jaguar as a home console.

There's no question about it. The company that gave us 'Star Raiders' nearly fifteen years ago could dominate again. If they get the marketing right....

Here's hoping.

Tony.

>Unless 3DO stomps the Jaguar...Remember Atari not IBM will need big bucks to
>advertise it and Atari does not have it...

Well, at $700 a pop, I doubt 3DO will stomp anything but the companies that
support it.
Side note, when the Sega genesis came out in 89, it was almost a full year
before any major advertisement was started. And the system was still selling
like hot cakes that first year. (I bought mine for $220)
I think the Jag will do well no matter what, so long it is in the stores with
a descent supply of games.
Remember, the Genesis is almost a 5 year old system, about the same age of
the nintendo when the genesis came out. The place is read for the next step.

>Not a chance...Remember the Lynx, it was technicaly superior to the lame boy,
>but which one sold the most.....Remember History tends to repeat itself....

Yes but keep these in mind:
1. Atari didn't make the lynx, Epyx did. And atari OVERPAID for it. And
when Epyx went out of business, atari wasn't really ready to make games
for it. So it was several months before games came out for it on a regular
bases
2. The lynxs was selling for $160+ and the Game boy was 70+. Which one
would you buy for you kisd at home.
3. Nintendo had THE name reconition back then. Anything with their name on it
sold. Today, nintendo is a distant second. Atari's concern is the Genesis
by Sega.
4. History has yet repeat itself in the video game industry.
from 77 till 83, Atari rules
from 84 till 85 (my guess) Colleco
from 86 till 89 Nintendo
From 90 till present Sega.

I would like to get my TT to run an XWindows server and communicate over Ethernet (TCP/IP) at the university, here. Does anyone here have any recommendations on hardware/software? Or does anyone know of US distributors for such products?

I have seen Michael Gehret's X/software mentioned in X11/contrib/XServers-NonUNIX.txt. Are there any others, now? And which Ethernet card would people recommend?

Thanks in advance. (I will try to compile info for anyone else interested)

I'm looking for a guy from Hawaii who sold me a MagicSac+ and two games! If this isn't you, please don't bother reading...

I just got my check back in the mail! I guess there was some problem with the address or postage (it doesnt say...). Please contact me again and tell me the best way to send you a check in the mail. Is there some special postage rate to send to Hawaii? Also, please send me your address again since I guess I got it wrong...

You were great to deal with and I'm happy with what you sent me, so I feel I should track you down to pay you! :-)

thanks,
.s.

I know of no FREE newsgroup or ftp-site which carries any stock information.
There is a news service provided by ClariNet which does carry this information
for a subscription fee. Sorry, don't know their phone number, but one of
their employees used to moderate rec.humor.funny a while ago. The news
service is internet-based, I think.

'Atari' is the word for capture used in the Japanese game of go. When you
capture the opponent's stones, you yell 'atari'!

Kenny Yan. kennyy@bnr.ca
The above is not a BNR opinion/view/comment/press release.

1316. Atari STe and s/w for sale

Newsgroup: comp.sys.atari.st
Date: 1993-07-02 15:02:41 UTC
From: jharres@batman.bmd.trw.com

Source record: 203880
Cross-posted to: comp.sys.atari.st,misc.forsale.computers.other

I have the following for sale:

1040 ST $100
Has 68000 in socket, internal clock(needs battery)
No problems

1040 STe (1 meg) $350
No Problems

SC1224 color monitor $175
Original (circa1985) no problems

Gemini 10X printer $50
No problems

Would prefer it to go as a package, ie won't sell monitor until CPUs are gone. STe with monitor and printer for $500. Shipping not include. No reasonable offer refused.

Have the following software for the ST:

LaserC $40
LaserC Debugger $20
WordPerfect $35
Printmaster $10
Regent Base (database) $15
EZ Calc (spreadsheet) $10
Copy II ST $5
COLR Object editor $3
Disk Doctor $5
All Start mag Disks $20

Games:

Shanghai $15
Battle Chess $15
Leather Goddess of Phobos $8
Winnie the Pooh $8

Again shipping not included. Software can be had for a greatly reduced price if purchased with a packaged computer deal above.

NO REASONABLE OFFER REFUSED.

>The deal was 500M contract over a 3 year period or 166.67M / year

Frequently the dollar value of this sort of deal only reflects the maximum number of units which might be produced under the terms of the contract; in other words, IBM may have agreed to build "up to 5 million Jaguars" over the term of the contract; if Atari pays IBM $100 each to build these, it becomes a $500,000,000 contract (at least as far as press releases go), even though no money may ever change hands (if the Jaguar never gets released). Therefore, Atari would definitely not need a $500 million line of credit to make this sort of deal...

I've been using the Prospero Compiler in its various Versions for years. In my opinion it is excellent - fully ANSI Standard and includes (in its latest versions) GEM and AES bindings. They don't supply GEMDOS bindings - but if you have GST's ASM assembler it is extremely easy to code them and make your own Library which is fully compatible with the GST linker used.

Prospero executable code is adequately fast (I've not come accross anything that beats it comprehensively on Floating point instructions - MIPS (if you like)). The code produced is not exactly small - but if you pack your progs with ICE or PFXPAK then they do become quite small.

One minor point to those with TOS 2.06. If you divide by zero or similar - Prospero Fortran gives you a form-alert with the option of continuing. This feature does NOT work on TOS 2.06. If you divide by zero you are "bombed" out of the program unceremoniously. Usually though it is fairly easy to safeguard against this. I should add that all else behaves _normally_ with TOS 2.06 - and you should not be put off buying the Prospero Fortran if you are in the market for a Fortran compiler.

Cheers,
W. Alan B. Evans

They won't learn much about advertising (though IBM is actually getting
some out there unlike Atari), but maybe, just maybe, they'll learn about
customer support. IBM's support of their own products has been
incredible forever.

1324. Gulam/Uniterm/TeX

Date: 1993-07-02 17:16:31 UTC
From: lombardo@cwis.unomaha.edu
Message-ID: <lombardo.741633391@cwis>
Source record: 203845

I have a couple of quick questions. I just started using Gulam and I also wanted to try using TeX and Uniterm. At first, I couldn't get uniterm to run from gulam because I used

alias uni gem c:\uniterm\uniterm.prg

and it couldn't find the resource file. I replaced it with a command to switch directories, run the program, and then switch back to home. Well, it worked. But, I still can't get the uniedit.prg file to run, whether from the desktop OR gulam. What does this program do? And why does uniterm come with so many fonts? I don't see any options in the program to change fonts!

About TeX: I grabbed the Cs-Tex-4.0 files from a.a.u.e. and extracted all of the .lzh files from the .zoo files onto my hard drive. Then I run the install program and it only installs from floppy to hard drive, not hard drive to hard drive. How many hard drive users would want to use floppies in the first place? Is there a better way to install this?

By the way, what is the difference between a .ps file and a .dvi file?

CIAO!

> distribution, will it be labeled an Atari product? Probably...

It'll be the "Atari Jaguar"; NCR similarly builds/tests/packages
hardware for other companies.

This is a _very_ good thing for end-users; there'll be fewer hardware
"jokes" in the Jag with IBM doing testing and quality control than there
have been with Atari products (remember the MegaSTe DMA chip problems?).

You probably already know the answer to that... after all, it's an Atari
product.

Source record: 203847
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

i am trying to install a mega20 on a 1040st.

i don't seem to be able to get the "C:" icon properly configured.

when i reboot the icon does not come back, yet it seems to have been
written okay into 'desktop.inf'.

also, the manual that i have is for a "SH Hard Disk Drive" (atari) and
the driver util floppy is marked "Advanced" HDI utils. i am not sure
that all of this stuff actually should play together.

any suggestions would be welcome.

thank you,

loren

There is no more Z*Net. They've joined forces :-) with AEO.

The latest AEO was sent (by me) to atari.archive this past weekend. I
made mention of this after I sent it.

DYNACADD is an excellent, full-featured 2D/3D drafting and design package.
It supports a wide variety of operations, 4 user defineable views into a
3D part and DXF export capability. A great package for serious design projects
yours for $165.

1331. Help! My ST is going insane

Newsgroup: comp.sys.atari.st
Date: 1993-07-02 21:04:48 UTC
From: elvis@watserv.ucr.edu
Message-ID: <33607@galaxy.ucr.edu>
Source record: 203754
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hi,
My ST seems to be exhibiting some strange behavior these days, and I was wondering if anyone out there has some suggestions as to what might be the cause. The first (and older) symptom is that every so often when I move the mouse, one of a few keys will start to auto-repeat (generally ESC, 1 or 3). My ST also tends to think that the Shift or Alt key is still being held down after I let go. I think these may have to do with the D.E.K.A. setup I'm using, but unfortunately I don't have the option of using the old keyboard, seeing as my ST is in a tower case now. So I thought I would check if there was another known cause.
The other problem is that when I exit a program back to the regular desktop the number of windows that opens (for directories) is always one less than the number I went into the program with. I.e. if I go in with three directories showing, only two will open up when I exit the program. It doesn't do this with NeoDesk, but on occasion I need to work from the built in Desktop (TOS 1.4). It doesn't seem to do this if I boot off the floppy, but does anytime after the hard drive has come up to speed (even if I hold down Shift-Ctrl-Alt to go to the floppy instead), even when I have no auto boot programs. Could the boot program for my Supra drive interface be messed up? My machine also seems to crash a lot more now then it used to, so I'm wondering if this is the most visible symptom of a deeper cause.
Any help would be appreciated.

Andrew Cullum (elvis@watserv.ucr.edu)

1332. Minixfs pl5 source available ...

Newsgroup: comp.sys.atari.st
Date: 1993-07-02 22:04:14 UTC
From: shenson@nyx.cs.du.edu
Message-ID: <1993Jul2.220414.7522@mnemosyne.cs.du.edu>
Source record: 203753
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I've just sent Minixfs pl5 to atari.archive and ftp.uni-muenster.de . Several
bugs have been fixed as well as a few new features. It should now work with
Falcon IDE/TT SCSI drives with huge partitions (though this isn't tested by
me because I haven't got the things!). An asynchronous updater has been added,
it should speed things up quite a lot. It also compiles now under mintlib pl32:
I've replaced all the gratuitious typedefs !
Read the file docs/pl5.doc for more info.
I've also made the 'copying' restrictions a bit tighter. Nothing drastic
just no commercial use without permission and no binary redistribution (if you
can't compile it then leave it alone!).
Also I've given details of the ICD software problem with a small test
program. Hopefully this will clarify the problem. If someone with ICD boot
after 6.0.6 would try this program and see if the bug is still present I'd
be grateful.
Steve.

|> place? Is there a better way to install this?

Apparently not; I tried the hard disk to hard disk install, and failed as well; I had to make those damn 8 floppies...

|> By the way, what is the difference between a .ps file and a .dvi file?

A .ps file is a PostScript file, and can be printed on any PostScript printer, or viewed with Ghostscript.

A .dvi file is the 'device independent' file produced by TeX, which requires further processing by dvips, or some other program to be converted to a device specific form. WARNING: these files can get rather large; it's often better to process directly to the printer, rather than to a file.

1334. MGIF 4.2 uploaded to atari.archive

Newsgroup: comp.sys.atari.st
Date: 1993-07-02 23:40:26 UTC
From: d8klojo@dtek.chalmers.se
Message-ID: <C9K9rF.GvA@news.chalmers.se>
Source record: 203758

The latest version of MGIF has been uploaded to atari.archive and should
show up in the graphics directory soon.

New features:

MGIF now runs in any of the ST/Falcon bitplane modes.
As before it uses three flickering screens of black and white to simulate
four grey scales.
However, users of the Falcon030 can also run mgif in the 15 bit true colour
mode! MGIF will then display pictures F-S dithered with 32 grey scales.
This really looks good!

GIF89 files can now be read. At least the two I have found.

Rotation to any integer angle.

Better support for running MGIF in a window.

Normal TOS wildcards (as used by fsfirst/fsnext) can be given on the command
line. For example: a:*.gif a:\ds*.jpg e:\pics*.*

The latest version of the Independent JPEG groups library is used. This means
that JPEG files will load much quicker.
I've loaded a normal 640x480, 80k JPEG in 15 seconds on my Falcon.

+ lots of other things.

I'll upload the complete sources (except for the JPEG library) to atari.archive
in the near future. The sources compile under GCC 2.4.4 right now if you can't
wait, but will support Lattice C 5.52 and Turbo C 1.0 shortly.

>sweetheart deal that they couldn't refuse? Something is -really-
>going on here...

IBM is out to diversify and contract itself to other people for more work. Atari had a job; IBM took it. Simple as that. The impression I have is that IBM was planning on doing this anyway, so it's hardly an act of desperation.

>> The biggest ATARI obstacles now will be:
>> *Software development- must be unique products that truly

>of product (Jaguars) ready for delivery (let's say) Nov. 1, 1993;
>and spend a few bucks on a junket for the top dozen or so retail
>chain buyers in the US and sell the suckers THIS year.

Problem is that, traditionally, Jack T. and the boys believe in advertising by word-of-mouth. I do not know how much of that policy is induced by insufficient capital, but one would like to think that Atari could and would market the bejeebers out of their products if they had the cash to do so.

On the other hand, Atari is going to roll out the Jaguar this year with some sort of "big press-conference" this fall; perhaps that is a chance to junket some retailers as well as introduce the product.

>> "Sega claims they are the 16-bit leader in game technology.
>> Atari agrees.
>> Today Atari presents their 64-bit game machine: Jaguar"

Too wordy. Off the top of my head, I'd suggest:

"64 bits. A leap beyond. The Atari Jaguar"

>But yeeesh... The doomsayers and the Atari Rulez people around here
>have got it all wrong; Atari is a (for all intents and purposes) is
>a privately controlled company; the stock prices don't mean anything;
>IBM will not really have a vested interest in whether Jaguar succeeds;
>the deal is -valued- at $500M over 3 years; that doesn't mean $500M
>will exchange hands; and yes, Atari makes good product, they just
>never have known how to market them; as long as Atari has a nice niche
>market for the computers (seemingly musicians and hobbyists) and for
>the game machines (which Jaguar -could- provide) Atari will be around.

One possible side-effect of the Atari/IBM deal is that it boosts retailer confidence in Atari. This _could_ encourage fence-sitting buyers to try to carry the Jaguar. "Well, IBM is backing them on this one, that shows some level of commitment"...

I'm guessing that Atari found IBM to be the low cost producer. If you check around a bit you'll find there are a number of PC clone motherboards that are actually manufactured by IBM priced at or near the price of imported ones. They certainly know how to manufacture an excellent quality product, too.

Yes, MultiTOS is available for the TT, at least in the UK. I bought my copy
from System Solutions in Windsor. It is also available from HiSoft. Together
with SpeedoGDOS, the cost was UKL50 which I believe is about to rise.

Note that there is no TT-specific version of MultiTOS. It can be installed
on (theoretically) any machine with sufficient (i.e. >=2MB) memory.

I don't know, but I was irritated by this, too.

>By the way, what is the difference between a .ps file and a .dvi file?

They are both machine-independent page descriptions, but different of course.
Postscript (*.ps) is a stack-based interpreted language for describing
documents, and many laser-printers (eg Apple LaserWriters) have a postscript
interpreter built in. The other you mention (*.dvi) is specific to TeX, and
is the output of the TeX program itself. It has to be converted to a
format suitable for your printer by another program, called a Device Driver.

Since TeX users often print to Laser Printers, there are a number of
programs around for converting .dvi files to .ps files.

Hope this helps some...

It's out in the UK. MultiTos is the same for all machines BTW. It's
either free with a Falcon or 30-50GBP depending on where you buy it.

Hi All.
I Have a friend who has an Atari STE. (I am on a PC now).
I want to help him find programs for his computer, but I don't know
where to start. Can anybody mail me ftp addresses or other ways to get
atari software through modem?

Thank a lot,

Antonis Plevrakis,
Crete, Greece.

1350. Cs-TeX Installed. Now what?

Newsgroup: comp.sys.atari.st
Date: 1993-07-03 13:18:26 UTC
From: lombardo@cwis.unomaha.edu
Message-ID: <lombardo.741705506@cwis>
Source record: 203775

Okay, I finally copied everything to floppies and used the install program included to install 6 of the 8 disks onto my hard drive (I left out BIBTEX.LZH and the laser printer driver stuff on the last disk). The readme file says that after selecting your favorite text editor "you are now ready to process the pre-selected file 'CS_TEX.TEX' which ist the documentation for the system.

First of all, I don't even have a CS_TEX.TEX file. The ATARITEX.TEX file seems to be the documentation, but its in German, so I have no idea. What's the deal? Should I have a CS_TEX.TEX file? Which archive was it in?

Second of all, how do you go about processing the pre-selected file? THe only option that really runs is the text editor and the initex thing (but which .INI file should I select?) TeX doesn't seem to run at all. Does anyone have a good ENGLISH introduction to TeX and how everything comes together (which programs do what) that is in ASCII format? All of the TeX intros I have are .TEX format, which seems rather stupid to me.

Any help would be appreciated.

1351. MC 68060 - Whats the info on this New chip?

I have just read that Motorola will deliver the first 68060 to selected
customers. I dont have any info on this chip, other than

1. Like the Pentium it uses Superscalar technology
2. Internal FPU
3. 8k Data and command cache.
4. there are/will be 50 & 60 Mhz versions
5. Atari wont use it until it out of date ;-)

THere is a program called VIEWER00.PRG that will display JPEG
pictures on the Falcon directly, without conversion. It's also
very fast, since it uses the DSP. Should be on atari.archive.umich.edu
someplace.

Since when? Dang, I was enjoying the program for a while, despite its incompatability with some software. I was hoping upgrades would fix the problems, but now it looks like time to consider MultiTOS instead.

HiSoft are the UK distributors for MTOS - I've not got their number or
address to hand but they advertise on the back page of ST Review and
ST User almost constantly. I think it's 39UKP, but that might be 49.
They are - or possibly were - doing it in a pack with Speedo GDOS.

Close, but no atari. Atari _is_ a Japanese word, but it means "hit the mark" or "Bull's eye!" (ref. my Japanese teacher), maybe even "Gotcha!". According to Takahashi's Japanese-English Dictionary it means "a hit, a success". Maybe the Jaguar will put the "hit" back into Atari.

In addition to the 17 Falcons that ATY Computers in Oakland, CA received yesterday, he also got stand-alone versions of MultiTOS and AtariWorks, as well as Compo's DOS emulator and the ScreenBlaster for the Falcon. ATY sold 5 of those 17 Falcons before noon yesterday.

Er.. um... "atari" may have a general definition in the Japanese language, but the origin of the company name is indeed derived from the game of GO..

Nolan Bushnell chose the word to name his new company back when he started producing "Pong"...

The term, from the game of GO, is roughly equivalent to "Check" in chess.. in a well-mannered game of GO, you're supposed to warn your opponent that you've created a potentially winning situation by saying "atari".

As a further little irony, or twist of fate, when Bushnell started a new company to make high-tech arcade video games after selling Atari to Warner Brothers, he named the new company "Sente".

Turns out that a successful counter to an "atari" situation in GO is described by the Japanese word, "sente"...

I have archived every message I've downloaded from the Atari ST Roundtable since the middle of 1991. I was planning on uploading them to atari.archive, but a.a is short on space. I have 22 1.44meg HD disks filled with these archives, and it's constantly growing.

If anyone's interested in these files, let me know and we'll find a place to put them or a way to get them to you. I really don't want to keep them any more, although there's tons of good hardware and software info contained in them.

No. There is no Amiga Emulator for the Falcon. But you can get a new Amiga 600
for $199 from Creative Computers...

>problems, but now it looks like time to consider MultiTOS instead.
As soon as it is available take a look at Mag!X 2.0 by Bela. Mag!X 2.0 supports preemptive multitasking and is especially interesting for those who have an ST on which MTOS is too slow to be really useful. Mag!X 2.0 is supposed to be available in a couple of weeks. I'm working with a beta version. It's very fast and much more professional than MultiGEM was. (MultiGEM never worked reliably with my machines.)
BTW, Mag!X runs on ST and TT, not (yet) on the Falcon. A disadvantage of Mag!X: MiNT won't run on it.

As I understand it, just as "atari" is the rough equivalent to "check" in chess, "sente" is roughly analogous to "checkmate" in the same game. Seems Bushnell was a pretty big Go player at the time he started Atari.

On the other hand, proving that names don't mean diddly-squat, Sente the video-game company is now nothing more than a fading memory. The first Sente games got little distribution and even less appeal (the only one that most folks really remember was SNAKE PIT), and after four or five titles, it got absorbed into Bally and promptly forgotten.

And, of course, Bally is now part of Williams, and they do pinballs...

Actually, as I remember reading somewhere, Bushnell's original choice for a company name was some obscure medical(?) term like "Zyxzz", or "Xyzzx", or something similar (it's a _really_ obscure term). He would have used that fior a name, except there was already ANOTHER company around at the time who was using it...

>They don't supply GEMDOS
>bindings - but if you have GST's ASM assembler it is extremely easy to
>code them and make your own Library which is fully compatible with the
>GST linker used.

This statement is a little misleading. There is an interface in
Prosepero Fortran to access GEMDOS, BIOS, and XBIOS functions. They
aren't called by name but by function number. The SYS function calls
GEMDOS functions, the BIOS function and XBIOS functions are obvious.
What you need to do to use these function is set up an array (they
call it a parameter block) which defines the values pushed on the
stack for the appropriate trap. If you wished to define the GEMDOS,
BIOS, and XBIOS functions by name, you could easily build them in
Fortran using these functions.

BTW, there are Line-A bindings too.

MultiTOS was just released to the major distribution channels. You should be
able to get your hands on it in local stores (presuming you have any nearby)
by Wednesday or Thursday this week...

Look for it being priced around $50.

Same for SpeedoGDOS ($50) and AtariWorks ($99)

If you don't get a C icon when rebooting, then the system did not see
the hard drive. Run HINSTALL. If that fails to resolve the problem,
then check your cabling or go visit a repair center.

>fior a name, except there was already ANOTHER company around at the time who
>was using it...

From "Video Invaders", by Steve Bloom, p.77:

"Contrary to what you might think, Atari is not a Japanese company.
This misconception could easily have been prevented had Nolan Bushnell,
Atari's founding father, been able to procure the name Syzygy, which
he had originally selected. Bushnell chose the word for its spacial
significance: syz-y-gy signifies the nearly straight-line configuration
of three celestial bodies (as the sun, moon, and earth during a total
eclipse) in a gravitational system. (Thank-you, Webster's.) However,
Bushnell was not the only entrepreneur fascinated by this celestial
image; it was already someone else's corporate handle. Bushnell, an
avid devotee of the Japanese board game Go, then decided on "Atari",
which in Go is a polite warning to your competition that he's about
to be engulfed. It's more or less the equivalent of "check" in chess."

(Video Invaders, ISBN 0-668-05520-0, Arco Publishing, Inc., (c) 1982)

Anyway, xyzzy was from Adventure and then from Infocom games (which is where
I first ran into it - sue me for being young).

>P.S. One has to admit one thing -- Atari has one cool corporate logo. B-)

Agreed. No matter what Atari looks like today, I still remember it as it
was in the early's 80s: the coolest company on the planet. Ah, games were so
much more fun, then... :)

For Sale:

Atari 520ST
Mono Monitor
2 MByte Memory upgrade (2.5 MByte total)
ICD Hard Disk controller with battery backed clock
80 MByte SCSI disk
Double sided 3.5" floppy drive
Double sided 5.25" floppy drive
TOS 1.4

Lattice C Compiler
Various games
Standard Atari software (1st Word, Basic, Logo, Database, NEOChrome)
Various PD software (minix, games, GIF/JPEG viewers)

GEM Programmers guide
Atari internals manual

Loads of blank floppy disks

You can have the lot for 300 pounds, or I will split if necessary.
Please reply by email.

1390. MODEMMidi / 16+ wont work on Falcon

Newsgroup: comp.sys.atari.st
Date: 1993-07-05 10:47:28 UTC
From: thumpy@dcs.qmw.ac.uk
Message-ID: <C9otz5.H9G@dcs.qmw.ac.uk>
Source record: 203869

After 'phoning Harman Audio UK's Cubase helpline a while back and being told that the above devices should work with a Falcon I now find (after having bought one and struggled with it for a week) that they won't. According to a Steinberg guy on the cuabse-users mailing list, EXPORT.DRV can't cope with the changes that Atari made to the serial port hardware. I'm not happy.

Of course, someone has. Over here in Germany it is very popular among maths and physics-students.
In my opinion it is the best program for editing and printing formulas and tables, once you are familiar with it.

If you're speaking of Zoo 2.10, release 4 of the port of Gereon Steffens: // isn't a standard directive found in Zoo. Gereon's Zoo port just is a port of the original version. You might use something like

```
find . -print | zoo ahI zoofile
```

or even

```
find | zoo ahI zoofile
```

if you have a shell that has pipe syntax.

[Sorry for deleting so much; I never saw the beginning of the thread.]

There's a working Fortran compiler on atari.archive.umich.edu; no GEM
bindings or VDI bindings, but who'd be foolish enough to do that sort of
programming in Fortran?

The compiler on atari.archive is enough to get through that evil 1st
year CS course... ;-)

:
: Atari's BBS should be up and running. Haven't neard anything about
: Portfolio upgrades. I don't expect to hear of any either. Atari is
: better off concentrating on the Falcon and Jaguar.

I guess, but the Palmtop and PDA market is about to explode, and
Atari already has their foot in the door with the Portfolio. If they maybe
upped the RAM to 512k or 1mb, threw in a faster 8088 (don't they have 10mhz
versions?), improved the screen so you could get 80x25 for VT100 etc., add
a PCMCIA slot and keep the Atari card slot as well... and then put a serial
port in... BOOM... there ya go.
Anyway, I called Atari's BBS and it kept ringing and ringing. Is
there a new number?

1400. Overscan

Newsgroup: comp.sys.atari.st
Date: 1993-07-05 20:50:12 UTC
From: wells_s@kosmos.wcc.govt.nz
Message-ID: <21a464INN7mf@golem.wcc.govt.nz>
Source record: 203882

A plea to anyone who has installed, or knows about installing, the Overscan (as seen in overscan.arc etc. on atari-archive, the PD version!). On an STFM-Revision D (Or compatible) motherboard....

I have all the parts, the only thing I'm unsure of, is which trace on the mother-board I'm supposed to cut. If I chop up the wrong one, I doubt it'd do the machine much good! (Routing 20Volts to the Eproms wouldn't do them any good that's for sure!)

So, if anyone can tell me, (or show me via a pic' file of some sort, even better!). I'd really appreciate it, as otherwise I've got $5 of parts which are no use to me! (Not much but, money is money!)

HELP!

Hi All,

I just wanted to re post my offer to swap two bare Segate
ST1096N 80 mb SCSI hard-drives for a stripped down production
Falcon (no ram, video, hd...).

Knowing about what you devloperes will pay for one off
these things, this is a real good deal for one of you to pick up a
couple of good drives for a decent amount .....

Both of these drives have not been used, only formmated for
use in my BBS.. but never got there....

I am willing to pay all shipping and insurance if you do not
live close enough for me to drive to you personally....

THANKS!

` Ziggy

1403. Bart's uuencoding question

Newsgroup: comp.sys.atari.st
Date: 1993-07-05 22:09:30 UTC
From: gijs@mbase97.hacktic.nl
Message-ID: <H.eg.W9e8eKMLn66@mbase97.hacktic.nl>
Source record: 203712

I'm trying to figure out how to glue together those uuencoded mails from BART.
I do have uux789.zoo now, which is supposed to know about those
include files.
My question is: under what name do I save the files?
I receive my mail directly on the Atari ST, so I cannot save a file
like foobar.zoo.uac or something. Yet BART sends chunks which end in
'include foobar.zoo.uac'. I tried 'foobar.uac' and 'foobar_z.uac',
but without success.
Can anybody help me?

>filesystem, but not the RAM disk filesystem, and both are long filenames.
It might help if you mentioned the versions of Minixfs. 0.60 pl5 is the latest
and is source only. Basically if you can't recompile it you shouldn't touch it
until it's been tested more. It's on a.a.u.e .

>
> I was thinking of modifying the RAM filesystem to use the BLiTTER to do its
>memory copy functions, and maybe speed it up that way (make faster than the
>blazing it already is, much faster and more compatible than any other RAM Disk
>I've used). I wish I could make it fragment RAM less.
This is a common misunderstanding. A blitter is not much quicker that a few well
place movems. After all that effort you might get 10% performance increase if
you are lucky. On a TT and TT ram you'd probably make it slower.
Steve.

1405. How to upgrade MEGAST2

Newsgroup: comp.sys.atari.st
Date: 1993-07-05 22:27:22 UTC
From: tyjori@uta.fi
Message-ID: <21a9saINN5ko@kielo.uta.fi>
Source record: 203888

Hello.

I bought Atari MegaSt2 few days ago. For curiosity I opened
the cover and I noticed that there are empty places
for additional memory.

Could I get totally 4 Mb memory just simply adding
1mb dram chips ?

I've been upgraded my previous st520 to 1mb and
it was quite tricky (poor power supply).

Hmmm... is it worth of it ?
- is there use for extended memory

Do I need additional components - other than dram chips ?

-jr

1411. Specs for Atari PCC1424 VGA monitor needed

Newsgroup: comp.sys.atari.st
Date: 1993-07-06 02:48:56 UTC
From: mbl900@anusf.anu.edu.au
Message-ID: <21ap6o$cmu@manuel.anu.edu.au>
Source record: 203893

I have just aquired the above monitor for use with my 386 pc. I have both DOS and Unix (386bsd) on this system. It works fine under DOS but I need to know some of it's specs to make it run under XFree86 (X-Window for 386bsd). The things I need are :
Bandwidth
Horizontal sync frequency
Vertical sync frequency

Can anyone help? Thanks in advance.

Unfortunately Atari had nothing to do with the design of the Portfolio,
and I believe it would be beyond their ability to do anything about
creating a more capable and competitive version...

If they could get D.I.P. in England to upgrade the design, maybe...

> I've used).

I don't think it would be worth the trouble. On a lowly 8 MHz ST, the
processor can move blocks of memory at 13.5 Mb/s. The blitter could
be a little faster because it doesn't have to fetch command opcodes
in-between, but on the other hand, you have to set it up before
the transfer which for smaller blocks more than weighs off the speed
gains. On a 68030 system, the processor could even hold the copy
loop in its cache, and the blitter would probably have no
advantage whatsoever! The blitter really excels at transfers that
are not word- or even byte-aligned, but RAM disk data are always
word-aligned.

> Has MultiTOS been released? I mean can I buy it from the local dealer (US).

I don't know about the US situation, but MultiTOS has been available
here in Germany for quite some time now.

Hi yes you could need the small Caps that are along side the Rams.
0.22uf mono types also there could be 2-3 resitors, 33 ohms or 68 ohms
I don't remember witch, you will find a small group of resistors near the
rams..

Speed of Rams 150ns or better...

I think that you will find that its 256k rams that are used..??

how many rams are there..??

Help! :)

I've recently stepped into the wonderful world of listening to and writing MOD files. So far I've been using an old version of NoiseTracker (or something like that; it was supposedly written by "Dr. Death"). My problem is that this software is very buggy, does not make use of my STE's stereo ability, in addition to the fact the any "new" protracker MOD's will cause it to crash during playback.

Is there a *good* MOD editor/player out there? I have "Paula", which plays back MODs wonderfully, but has no editing capabilities. I don't care if it's shareware or commercial, but does such a program exist, and if so, where can I get my hands on it? :)

Please reply thru e-mail, because my access to this newsgroup isn't all to regular... thanks!

1419. Quantum ELS 170S - how to disable parity ?

Newsgroup: comp.sys.atari.st
Date: 1993-07-06 12:28:04 UTC
From: mbaumgar@iiic.ethz.ch
Message-ID: <1993Jul6.122804.7932@neptune.inf.ethz.ch>
Source record: 203701

I have to disable parity of my Quantum ELS 170S to connect it with ICDs
'The Link' SCSI hostadapter to my ST.
I think this can be done by software through the change of some Mode Select
parameters.
Who knows, which paraneter I have to change and what the values
for the 'Vendor unique'-, 'Flag'- and 'Link'- bits in the Mode Select
command are ?
Clearly it would be much easier, if there are any little programs (Macintosh),
which allow to dis/enable parity.

>I don't know, but I was irritated by this, too.

Why are you irritated about this? The main distribution medium for CS-TeX
is floppy disk. So, the install program expects 8 disks. Whether you got
those disks in the mail or you ftp'ed disk images or created the disks by
unpacking 8 zoo archives is of no concern to the install program. After you
installed CS-TeX you may safely reuse the disks.

Would you rather have 8 .msa-Files to download? I hope not.

>know what the problem is?

Well, it's probably what it says.

ST-GOFER is a port from a UNIX source.
Therefore it needs quite a lot of RAM for its internal static structures.
2 MB should be enough, but it's definitely not much.

If you want to run GOFER on such a small machine, try the following:

1.
Run GOFER as a TTP and limit its memory consumption using the
appropriate parameter (I think it was -h. Try -h10000 or so).

2.
Buy more RAM for your machine. 2 MB isn't much at all.
Especially if you want to use MultiTOS you'll need more RAM real soon.

3.
Buy VRAM (by Overscan) or OUTSIDE (by MAXON).
It will add virtual memory to your system and will swap it to or from your
hard-disk. I'm using VRAM on a removeable Syquest-88-drive and it works
fine and doesn't slow down your system too much, what makes it a cheap
alternative to more RAM.

4.
Ask the author of ST_GOFER (me) to recompile it for a smaller machine.
This won't happen too soon, since there are allredy complaints by some
users who want an even larger GOFER to run their sources.

Anyway, with only 2 MB RAM I strongly reccomend to buy more RAM or
a virtual memory manager.

Regards,
Laurenz

>sort of deal...

I think you got it backwards. In my experience with deals like this
Atari would be _required_ to buy $500M worth of Jaguars and if they need more
that is fine. In other words $500M is the minimum, not the maximum.

1424. Archiving trees with ZOO - the FINAL guide

Newsgroup: comp.sys.atari.st
Date: 1993-07-06 15:39:08 UTC
From: nollert@nova.tat.physik.uni-tuebingen.de
Message-ID: <nollert.741973148@nova>
Source record: 203706

Since this topic has attracted some interest over the last few days,
and nobody has REALLY settled it, here it comes:

THE DEFINITE GUIDE TO ARCHIVING DIRECTORY TREES WITH ZOO!!!

ZOO a// archive * archives the tree starting at
or ZOO a// archive . (and including) the current directory
ZOO a// archive a:dir\dir1 arcives the tree starting at the
or ZOO a// archive dir\dir1 given (sub)directory

In these cases, ZOO will save RELATIVE path information in the archive.

ZOO a// archive a: archives the whole disk A:
ZOO a// archive a:\dir\dir1 archives the tree starting at the
given directory

Here, ZOO will save ABSOLUTE path information in the archive.

ZOO a// archive a:. archives disk A:, with path information
in the form: .\dir\dir1...

And no, not all of this is obvious from the manual. And yes, I have
tried all of the above (with ZOO 2.1). And yes, ZOO creates the
necessary directories when extracting. And... any more questions? (I'm
sure you'll think of some...)

Happy archiving!
Hans-Peter

TEAC is the suggested drive to use when replacing an ST device, so you
are probably in luck. As for how to do it, one must build a magic cable
and do a little bit of tweeking with one of the lines (I seem to remember
a resistor needs to be added or some such). I uploaded instructions to do
this for both 3.5" and 5.25" drives to atari.archive.umich.edu several
years ago, in a file called ibmdrive.lzh.

Also, here are some comments I got after the upload (they concern 5.25" drives,
but they may be useful to you as well). Note that I did not actually write
the files. I just put them on atari.archive.

Mickey, (and anyone else interested)
I have have read your files and they are excellent! I had an idea to possibly
simplify the process though. Now, I really should try this before speaking,
but hey, I'm impulsive and irresponsible ;^)

Wouldn't it simplify the process if instead of cutting and modifying the
existing drive B cable (assuming you have one) you opened the case of the
ST and tapped onto the internal ribbon cable (the one attached to the
internal floppy) using a daisy chain type thing? Like:

```
/-------------[]< card edge to external floppy
|
--------[][]------------[]
Internal Cable ^ ^male end ^female end to internal floppy
```

I just say this because ribbon cable is so much easier to work with than just
about anything, just using a vise, pliers, or vise grips to press the ends
into place. You would then have to change the Drive select jumper on the
external from 1 to 2 (or from 0 to 1 depending on labels used).

One would probably want to hang a ribbon header out the back of the ST case
to allow for disconnection.

Do you think it will work?

Regards,
Doug

Yes, This is exactly what I did with my ST. Worked like a charm. The only thing that you need to watch for is reversing the cable when you plug it into the new drive. You can tell its reversed because the drive lights go on as soon as you turn the computer on and they stay on constantly.

Later,

```

1426. CTEX_E Make fonts?

Newsgroup: comp.sys.atari.st
Date: 1993-07-06 16:21:21 UTC
From: lombardo@cwis.unomaha.edu
Message-ID: <lombardo.741975681@cwis>
Source record: 203709

I have successfully gotten the CTEX_E shell program to take a .tex file and make a .dvi file AND preview it. I have also gotten it to print, but I have NOT gotten it to make new fonts (with metafont). When I go to FIND and go under C_MF (which I don't think was in any of the archives) it looks in the METAFONT folder, which I don't even have, for a program with a .PRG extender. Am I missing the program it needs to run the INIMF.TTP program and MF.TTP program that were extracted into the TEX/BIN/ directory?

By the way, I would like to use TeX without the CTEX_E shell, how can I do this? (Is there something I can ftp that would show me how to do this?)

Also, what is the difference between TeX and LaTeX? Also, when would I have to run TeX more than once on a file? (And how would I go about doing this?)

Thanks!

>the desktop OR gulam. What does this program do? And why does uniterm
>come with so many fonts? I don't see any options in the program to change
>fonts!

Uniedit was described pretty well in the docs... It's a very simplistic editor, written only as a demonstration of the $v (I think) Uniterm variable. You must run the program with the $v argument, which is a pointer to a table of Uniterm's internal variables, including the conversation and history buffer. The uniedit program lets you search around inside the history buffer, as I recall.

Regarding the fonts - Uniterm uses a large number of 'em, to handle the various combinations of 80/128 column, and G0-G3 character sets. There's a Load Font option, but I think that the included font files are already the same as the ones compiled into the code. Never did verify that...

>>

Actually, 'atari' is what you say when you THREATEN to capture an opponents
piece or group of pieces, or put another way, remove the second to last
liberty from a given piece.

Actually the ST250R does exist. At least it did for about 6 months. I used
to sell them. They were OK. The stats he gave sound right.

Yes the 250R is an RLL drive that is what the ending R is all about.
I am sure that is what is happening here. The RLL gets a bunch more
sectors per track than MFM.

> Agreed. No matter what Atari looks like today, I still remember it as it
>was in the early's 80s: the coolest company on the planet. Ah, games were so
>much more fun, then... :)

What *is* Atari up to these days? They seem to have all but
disappeared from the personal computer market. There was talk of a
dedicated DTP machine and a dedicated sound editing machine, but I've
never seen any of these in the flesh. Do they still make *anything*? :-)

In a very real way they were victims of their own success...they did
so well in the game machine market that no one took anything _else_
they did seriously. Commodore suffers from the same fate to this day.
The C-64 was so renowned as a cheapie computer that a lot of people
just don't take the Amiga seriously.

GOOD NEWS!!!!!

My brother just informed me that he found out from one of his fellow Clarkson Engineering graduates who works for Commodore, that Commodore has chosen the RISC chip of future amigas! (drum roll please...) As many have speculated, it is the DEC Alpha! They are planning on announcing this at WOCA-NYC during Lew Eggerechts speech. Better yet they will be showing in a semi-private session the prototype Amiga-A with the Alpha (100Mhz) and the prototype new high-end AAA Chip set! (This computer is not due out until mid 1994, however) Expect truely blinding speed in this speed demon!!!!!

More details as I recieve them.

Source record: 203716

```
The following is from a FAX I received from ICD:

1) firmware must be 4.05 or newer on the drive
(look for "Y4050" or higher version)
2) hook drive to system with a host adapter that
talks parity (standard AdSCSI)
3) run BOOTFIX.TOS (minimum version 2.13)
You should see the message "Quantum hard drive
reconfigured and parity disabled".
4) drive will now work with LINK cable.
```

>which allow to dis/enable parity.
>
>Matthias Baumgartner (mbaumgar@iiic.ethz.ch)

Here is the Data from ICD on this....

Quantum ELS with The Link: Problem and Solutions for drives made in 1992.

The following information is for owners of "The Link", a SCSI host adapter for Atari ST computers, and Quantum ELS series hard drives with firmware older than version 4.05. ELS drives with the newer firmware have not been shipped by Quantum as of this writing and probably won't be until sometime in 1993. Firmware version 4.05 or higher is required to disable parity on an ELS drive. Parity is not supported with The Link. Unfortunately a TT, a Falcon, or an ICD host adapter which does support parity is also required in order to disable it so be sure to have one of these available. The following ICD host adapters do support parity: Advantage ST, Advantage Plus ST, AdSCSI ST, AdSCSI Plus ST. The other models do not.

Included with this file are a special version of BOOTFIX.TOS from ICD and two other files from Quantum which will allow those with the knowledge and proper equipment to make their own 4.05 ROMs. ELS_S405.HEX is the 4.05 firmware code in Intel Hex format. ELS_S405.BIN is a binary image of the firmware ROM (binary format). These should have a checksum of $2E00 and be programmed in to 27C512 32 pin PLCC EPROMs or OTP EPROMs. Quantum has used Atmel AT27C512R-15JC OTP EPROMs so 150ns is probably more than sufficient.

An alternative is to call Quantum, explain that you need parity disabled on your ELS drive, and tell them that you need new firmware of version 4.05 or greater to support this. In the USA you can call 900-740-4433 to request new ROMs. Warning! You will be automatically charged for this call and I am not sure of the rate. If you are "blocked" from 900 numbers, try 408-944-0410.

Once you have the new ROM, carefully replace the old ROM, which is the only IC in a socket on the ELS drive PCB. Then connect the drive to a SCSI port

which does support parity, boot the computer and run the new BOOTFIX.TOS. After that, the drive will permanently have parity disabled and work with The Link. Our hopes are that dealers or distributors will offer this service to their customers since they will have better access to the required equipment.

Thanks for supporting our products and good luck!

Seems
> Bushnell was a pretty big Go player at the time he started Atari.

Actually the meanings are quite different from "check" and "checkmate",
in that neither term implies that victory is immanent. Definitions below:

Atari: an immediate threat to capture, only one liberty remains. A
verbal warning is often issued when placing an opponent in atari.

Sente: threat forcing direct response, creates initiative. Or the right
to choose where to play next.

"Sente" seems like an especially appropriate name for a company that
hoped to threaten Atari.

^^^^^^^^^

Ah, but there is a machine I would love to own. But are you sure on the
speeds? I know that some of the AXP PCs will be semi-castrated down to
about 66MHz (altho, I think this is mostly the buss limitation: the
low ends seem to be ESIA buss, and higher ends will have who-knows-what?)

>Lew Eggerechts speech. Better yet they will be showing in a semi-private
>session the prototype Amiga-A with the Alpha (100Mhz) and the prototype new

And lets hope that in 1994 prices will drop. I think the AXP PC 150
is priced at $7000, diskless! (altho, I dont have the DEC brochure
here to quote directly from... and we all know DEC hikes prices up to
where no mere mortal can afford things...)

I would rather have the ability to re-assign the path for .zoo archives
to something besides A:\ ; if someone has enough disk space to install and
run TeX, they may have enough for all 8 .zoo files as well. (I did.)

I also felt being forced to make 8 floppies complicated the installation
procedure needlessly; I got the 8 files via ftp and xmodem (9600 baud), so
I did not already have the files on floppy disks.

Nolan Bushnell founded a company called Sente in the mid-80's; they made
stand-up arcade games which all operated on the same basic hardware. So,
if you got sick of your old Hat Trick game (two-player ice hockey), you
could swap a board or two, and the control layout board, and get a Trivial
Pursuit(TM) game instead. They also had a pool simulator, and as I recall
pretty much _all_ the games were that dull except their first one...
which I've forgotten. This is why the company immediately went the way of
the dodo.

+----------

Well, yes, quite frankly, and from Atari no less.

Atari's market presence has faded, over time, here in the US; they are
much stronger in Europe, however, where the ST/TT series of computers are
viewed as a viable business computer. However, they are still being produced,
with new models coming out all the time. They made a portable version of
the ST, the STacy; a notebook, called the ST Book; and the TT series is
itself a lot of bang for the buck.

The software has never been all that great, unfortunately. OS development
plods along, and while they do sort of keep up with the outside world (they
introduced scalable font technology recently), seeming the US market
doesn't care. Business software, word processors, spreadsheets... all
available, but all usually at least a _little_ goofy.

Atari's dealer channel has slipped away over the years, and Atari doesn't
really believe in paying for advertising -- they seem to think word of mouth
can carry them through. This is probably where these weird rumors started;
if you don't see a company advertising heavily, you start to wonder if they
still exist.

Atari just introduced the Falcon 030, a descendent of the ST/TT series
of computers adding serious multimedia support. The computer has a DSP
chip, can talk to IDE drives, has real whizzy graphics, and can do genlock
really cheap. It's a real neat machine, but nigh upon impossible to find
in the states.

1446. ATARI 1040ST + for sale

Newsgroup: comp.sys.atari.st
Date: 1993-07-07 00:11:49 UTC
From: cleaves@venus.ctron.com
Message-ID: <21d4c5INNgri@ctron-news.ctron.com>
Source record: 203733

For Sale:

ATARI 1040STf - 1 Meg, 68000, Dallas Semi Real Time Clock
Atari SC1224 - Color (Low and Medium res) monitor
Atari SM124 - Monochrome (Hi res) monitor
Atari MegaFile 30 - 30 Meg Hard Drive
Supra Hard Drive - 85 Meg hack in Supra shoebox.
Spectre GCR with ROMs - 1 Large Partition already setup with 6.1.7,
about 150 floppies of MAC stuff. Drive cable
included for reading and writing MAC floppies.
Monitor Switchbox - semi hack, but works well.
Mouse/Joystick Switchbox - Total hack, but one which I'm proud of.
Official but Ancient Atari Joysticks (2).
Chic Hi-Res Mouse

Commercial Software:
Timeworks DTP, Partner ST, STOS, Lemmings, Gold Rush, Turrican,
Oids, Sundog, Dungeon Master, Falcon, NeoDesk 3.0
Tons of PD stuff, at least 150 floppies worth.

Hard Drive setup is quite good, Have Neodesk, use SuperBoot, have Gulam
and Sozobon C all set as well as other dandies. This machine has been
reliable and fun for a long while, and will only be sold as a package.

Asking $700.00 or Best Offer, you pay shipping.

Available Seperately:

SuperCharger MS-DOS add-on for the Atari ST - due to unfortunate drive
configuration this will not work with the rest of my system, so I
do not suggest you buy both unless willing to scrap the Supra. However
this little box is great. I did most of my CS programming on this in
both Turbo Pascal 6.0 and Turbo C++ 2.0 and had no real problems. It is
quite fast considering what it does and can even handle graphics
programming (though the color limitations are a drag.)

Best Offer takes it.

>get my hands on it? :)

Sorry I cant quite answer this question. Take a look on
atari.archive.umich.edu, in the atari/Sound... directories, I know
something is there, but dont recall the names...

Also, is there a MOD editor that will work in monochrome? All the
ones I found want medium rez, which dont do me no good...

While reading news I use "s" command to save the posts to my [.news] directory. Then I type "uuconvert file1 file2 file3". That's in case the actual binary is made of several blocks. I find this method easiest. Ask you system operator if you have access to a uuencoder on your system.

Yeah, but if you have 30 million IBM PCs and 50% of users are pirates,
you still have a consumer base of 15 million. If you have only a few
hundred thousand Atari users (this is a wild guess, but I know the
figure isn't anywhere near the IBM figure), then a 50% piracy rate
doesn't leave much of a market at all. (the piracy figures are
guesses, too, but the basic idea is the same)

Come on you guys! I've been noticing these relentless attempts to define the JAPANESE word, "Atari." Do you really think Atari co. wanted their product to mean, """attempting to attack""....????? come on now.

Actually, in Japanese, the word simply means "right", or correct. Ask any Japanese person.

I think this definition is more appropriate.

Chris.

1456. Tower case for Falcon?

Hi!

I am planning to buy Falcon w/o HD and tower case for it from Germany. So I'd need some information about the cases... Is there any? What these packages contain (PSU?, cables?, connectors?), how much they cost (in DM)? and where to get them? I am going to visit Frankfurt, Kaiserslautern (and maybe Stuttgart if that is necessary to get what I need). Any comments about your experiences in assembling the system are also welcome.

Please, reply by mail. Thanks.

- TMo

FOr that matter, who cares what it means? We've been told the same
meaning about 15 times.....

As stated, the creator was a 'GO' addict, and in the game Atari meant
'prepare to be boarded' etc. That's it. No more - we've even been
quoted the GO doc's!

I use Wizzcat(of DF)'s ProTracker ST, which fully supports the STe stereo
sound. It also replays at 50 KHz when using a MEGA STe, and the sound
reproduction is simply wonderfull. Now that he has left the net, however,
it is hard to communicate with him, and especially now that he is inter-
railing down Europe during his holiday, unix1.mrih.no is down at the moment,
but he will have an account there as soon as we get it up again in August.
I have some _unofficial_ information that he is thinking of going shareware
- well, that was what he said last time I got to speak to him.
The tracker runs on low-res and has the same layout as the ProTracker on the
Amiga. It also loads most Soundtracker/Noistracker/ProTracker format modules
as well as Sync Tracker and TCB tracker. I have seen a TT version as well,
but I don't know if that one is ready for release. In addition, there is an
ST version. I don't know if he is going to do a Falcon version, but both I
and Kai (co-edito Scriba Communis Responsi) are pushing him.
And, oh yea! That miniature breakout game in the top right hand corner of
the disk menu... I did that one during one of those nights we (I, Wizzcat
and Gladiator) didn't know what to do, and we didn't have any pizza.

I guess Wizzcat's address will be karloey@unix1.mrih.no - but the machine
will probably not be up before in August, and I don't know how good his
internet access will be.

Cheerio, pholks! ;-)

Atari didn't name Atari, it was the guy who started it when it was a 2 man
company, and he called it Atari because he liked Go a lot!

It wasn't meant to mean "attempting to attack", he just liked the sound of it!

Could one of you more informed people out there post some actual information
about Atari and kill this thread!!!

Whats Atari's stock price at the mo?
Any specs on the Jag?
Is t true that Atari don't intend to have the Falcon as a mass market machine?
Will the Falcon be supported, or will it be another TT?

Any news on 68060?
And who exactly makes the PowerPC?

You can simply save the parts in the correct order into one file, then
run uud on it. If uud doesn't find the file specified with include, it
tries to read further in the same file for the next part.

Message-ID: <SAS.4.742045268@stpc.wi.LeidenUniv.nl>
Source record: 203747

Greetings.

As you may well know, Atari has released the Flacon. Enthusiasm all round, BUT :

I read a textfile on ACF yesterday, specifying the new Jaguar. From what I saw it is going to be a very, very mean machine. Furthermore, IBM has been involved in the development (financial reasons ..?)

Anyway, I am waiting a while before buying my Falcon. The development is going a bit too fast to really find the lasting compagnon, so to speak.

If I show you |
One corner of a square | Or Something like that ...
And you would be unable | Erik E. t' Sas

Let's be realistic. Have they actually told you that in the US? In Europe we are told that in *Germany* the ST/TT are viewed as a potential business computer, and I wonder what they say in Germany.

>The software has never been all that great, unfortunately. OS development
>plods along, and while they do sort of keep up with the outside world (they

The problem with OS development is that Atari should have 8 times as many people (I think they've got 2 currently) working on the TOS. They ideas are there, but there is never any time. What they should do is hire a small team of European developers (for example WINX should be integrated in TOS).

Hi netters!

Since I'm involved in games programming, I'm curious about the Jaguar.
(As is my employer...)

Could some kind soul please mail me the *official* press release concerning
the Jaguar? I've read it here several times, but I just lost it...

Which newspaper/issue could it be found?

And, very special, (yes, I might buy a development system), how to get in
contact with Bob Brodie via interNet (I've read that, too, but, sadly, this
f*cking S*N workstation decided to smash the hard drive before the backup...)

Please mail to Hessdorf@sun.ph-cip.uni-koeln.de

Thanx in advance!

Joe

Use TOS 1.04. TeX opens a lot of files, and TOS 1.00 has a lot of
bugs and problems in its file and memory handling code. The least
thing you should do is to put FOLDRxxx.PRG into your AUTO folder.
